Dr. Hayward also testifies to the existence of these powerful natural forces which may be utilised for ventilation. "If, therefore," says Dr. Hayward, "the inlets and outlets be properly proportioned and open, the ordinary atmospheric pressure will carry on the ventilation quite efficiently, and the whole hospital will be kept fresh and comfortable by the natural forces alone. There is no fear that the speed will not be enough to keep up efficient ventilation—it is more likely to be too great; but there need be no fear of its being too great, because it is completely under control, and can be regulated to any rate desired by the valves at the ward inlets and outlets. Natural ventilation is certainly much to be preferred to any and every artificial system, whether on the plenum or vacuum principle, and it is, of course, much less complicated. It is, indeed, comparative simplicity itself—merely arranging openings and warming the air, and, as shown above, it acts more than efficiently. It also involves very little original outlay, and comparatively no permanent cost for maintenance. Whereas all artificial systems involve costly original plant of machinery, as well as heavy permanent expense for maintenance in engines, engineers, fuel, &c., and with all they cannot be made as efficient or nearly so pleasant and healthy in operation."

At the Public Health Congress held in London, there seemed to be a consensus of opinion in favour of natural methods of ventilation in preference to artificial, as also at the congress of the Sanitary Institute held at Liverpool, one of the speakers, Surgeon-General Sir Thomas Crawford, saying: "My experience of the process of forcing air into buildings is not in its favour. The only safe and sound means for the supplying of air is the natural one of obtaining it from a pure source in a free and natural flow."

Professor Wade, as the result of his experience of both methods, arrives at the conclusion that "ventilation can only be successfully accomplished at all times when it is effected without assistance from mechanical or artificial contrivances. However perfect these may appear, they can never achieve results superior to those insured by judicious and intelligent adaptation of natural means, and they necessarily suffer from the very serious disadvantage that they are liable to interruption without warning, and with possibly disastrous consequences."

Mr. G. H. Bibby, F.R.I.B.A., the author of several well-known works, on the sanitary construction of buildings, expresses the views of an architect, who is also an expert, on the subject. "Perfect ventilation," says Mr. Bibby, "may be obtained without liability to those dangers and difficulties to be met with where a natural system is set aside in favour of exclusively mechanical modes. The expense of mechanical ventilation is unnecessary, for there is sufficient evidence to show that such buildings as asylums, workhouses, and hospitals are best ventilated by natural means, and no architects of great repute or position have of late years relied upon mechanical ventilation."

The ventilation of the small-pox hospital ship

*Castalia*, by natural means is a striking example of the power of that method when properly applied. Messrs. Robert Boyle and Son, who may be said to be the first to introduce natural ventilation in a scientific form, having been instructed by the Metropolitan Asylums Board to apply their system to the *Castalia*. On the completion of the work the Board instituted a lengthy series of experiments to test its efficiency, with the result that the air-pump ventilators were found to be extracting at the average rate of five million cubic feet of air per hour, changing the air of the wards once every five minutes. On the calmest day and in foggy weather, when the external air seemed to be perfectly still, it was found that a powerful up-draught was always maintained in the shafts, and not the slightest down-draught at any time. There was also, even though the air was being changed so rapidly, an entire absence of draughts in the wards.

Perhaps the Long Room of the London Custom House is the most notable example extant of the efficiency of a natural system of ventilation, so many different methods having been previously tried without success, even though such eminent scientists as Professor Faraday and Dr. Ure essayed the task. Her Majesty's Office of Works finally called in the aid of Messrs. Boyle, who applied their system, with results which are now historic in the annals of ventilation, and which would seem to justify the opinion expressed in the report on the ventilation that they, "as founders of the profession of ventilation engineering, had raised the subject to the dignity of a science."

One passage in the report certainly appeals to us poor fog-ridden Londoners, and at the same time shows to what a high state of perfection natural ventilation may be brought. The report says: "Before Messrs. Boyle's system was applied there used to be a perpetual haze, or cloud, hanging below the ceiling. This has since entirely disappeared. In foretime, when a fog got into the room, it was several days before it got out; now, when a dense fog prevailed outside, the atmosphere of the Long Room remained quite clear, and continued so throughout the day."

The Right Honourable C. Seale-Hayne, M.P., speaking recently at a public function, said of the Boyle system of ventilation: "I believe it to be absolutely the best system of airing a public building that is known to sanitary science." Messrs. Boyle's system is extremely simple, and may be described as the application of means by which the natural laws of ventilation can be effectively brought into operation, the power which operates in producing the currents being as constant as gravity. Houghton says: "Science proves that there is not a moment of time but when there is a movement of the air, and this movement properly utilised is sufficient at all times to change the air in a building and secure ventilation."

These powerful natural forces are what Messrs. Boyle utilise to the utmost by the scientific arrangement of their system, and construction of the "air-pump" ventilator, with respect to the action of which Professor Macquorn Rankin reported, after twelve months' experiment, "There is no time throughout the whole year but when there is a sufficient movement in the atmosphere to cause the 'air-pump' ventilator to act."

This report was endorsed by Professor Grant, who stated that the air-pump ventilator was "constructed on sound scientific principles, acts in strict accordance with the laws of nature, and cannot fail to operate."

Messrs. Boyle have, we understand, successfully applied a natural system of ventilation to over one hundred thousand public buildings in various parts of the world, including hospitals, churches, schools, council chambers, &c., in many of which artificial systems had previously been tried without success. That engine-driving columns of air through a building does not necessarily ventilate it is evidenced by the following extract from a recent report on the ventilation of the Houses of Parliament:—

"When one considers the enormous volume of air, equal to ten times the cubic contents of the House of Commons, which is passed through it every hour, also that the elaborate tables of air analysis are apparently all that could be desired, and yet the ventilation is so notoriously bad, it is clear that there is something very radically wrong with mechanical ventilation by impulsion, and that tables of analysis and of volumes of air passed through a building are not to be accepted

be correctly indicating either the general purity of the air or the efficiency of the ventilation."

Such eminent scientists as Lord Kelvin, Lord Clifford (member of the House of Lords Commission on Hospitals), Sir Douglas Galton, F.R.S., Sir Benjamin Ward Richardson, F.R.S., Professor Corfield, Professor Shaw, and amongst architects Sir Arthur W. Blomfield, A.R.A., Mr. Alfred Waterhouse, R.A., and Professor Geo. Aitchison, R.A. (President of the Royal Institute of British Architects), testify to the efficiency of natural ventilation as applied by Messrs. Boyle. The system has also been extensively used for railway carriages, and in the leading navies and steamship lines, Sir Hastings Reginald Yelverton, First Sea Lord of the Admiralty, reporting most favourably upon it; while Dr. Nansen has expressed his high opinion of it as supplied to the *Fram*. It was adjudged the best and awarded the prize at the International Ventilation Competition, opened in London by H.R.H. the Duke of Edinburgh, when all the best-known natural and artificial systems of ventilation in use at the time competed.

#### THE PROTECTION OF SEA-BANKS.

IN a previous article\* we drew attention to a subject somewhat similar to that now engaging our notice; but while the former treated of the protection of river-banks, the present, as will be evidenced from its title, embraces a more extensive scope and a wider range. Although it must be admitted that the erosive and destructive action of strong fluvial currents upon the banks of a stream, especially if exposed to tidal influences, is both powerful and rapid, yet it lacks the rude shock and impactive violence of the mighty uncurbed and unbridled waters of the deep. Even when "warring winds have sunk to rest," and the surface of the ocean is calm and smooth, the same irresistible never-tiring agent is at work, and it is a matter of historical notoriety that, owing to its ceaseless efforts, villages, and even towns of considerable magnitude, have been undermined, swept away, and engulfed for ever beneath the billows. Since there is scarcely a country in the world that has not been at some time or another, or even is not now, liable to disasters of this description, it is no wonder that people have been compelled to devise and adopt means of protecting their habitations and themselves from these perpetual maritime encroachments. It is interesting to

FIG. 1.

observe that, in different countries, different methods and precautions have been employed, although all of them tend to the same result, and have the same object in view. If we may use the term, it may be truly said that every nation has a *fashion* of its own in its constructive works, and that the old French proverb *Autres temps, autres mœurs* has a more extended application than is usually given to it.

It may be here remarked that Nature herself provides certain defences, certain obstacles, and impediments against the encroachments of water upon the more solid portion of the globe called land. Perfectly so; but the attacking agent is also one of the forces of Nature, and so the everlasting struggle is continued with unvarying pertinacity. Where, then, Nature fails, she invokes the aid of her handmaids, Science and Art, and they never refuse to respond to her calls for assistance, and generally, by their united efforts, the desired result is accomplished. Among the natural defences against the assaults of the sea upon terra firma, the most difficult to overcome is solid rock. But even this adamant opponent yields, after a prolonged resistance, to the persistent onslaughts of the invading waters. The base of

the rocky cliff is gradually undermined until the superincumbent part projects over, in the form of a menacing cantilever, and on the occurrence of a great storm is hurled down with a crash that is heard for miles around. At the same time its fall arrests for a while the further disintegration of the natural monolithic barrier. The debris deposited at the base on the foreshore acts as a natural breakwater, and allows the rolling wash of the tide to spend itself unavailing upon its sloping profile. Ultimately, however, the same persevering cause attains the same end, and another

FIG. 2.

portion of the cliff is added to the many displaced and swept away. When, instead of a wall of stone, the natural defences take the form of sand-hills or sand-banks, the progress of demolition advances at a far more rapid rate. These fragile obstacles are either completely destroyed in a piecemeal manner, or, after many and prolonged attacks, are gradually attenuated until they are reduced to a mere narrow band or sandy ledge. This mere strip is utterly incapable of affording any further protection to the land and the people inhabiting it, which the original sand-dunes were intended to shelter, defend, and preserve. Under these conditions it becomes imperative to replace these useless and inefficient natural barriers by others of a constructive character, which will now be described more in detail.

Among the people the most interested in protecting their shores against the ravages of the ocean, the Dutch are, and have been from time immemorial, the most prominent. A large part of the Netherlands is well known to be below high-water mark, and it has been the threat alike of the invaders of that kingdom and the invaded to open the sluices and flood all the low-lying districts. To their credit, be it said, the Dutch made the sacrifice, and freed their country for ever from the occupation of it by the Spaniards. In Figs. 1, 2, and 3 are represented the general form of sea-wall, which may be accepted as the characteristic type of that particular example of construction adopted along the coasts of Holland. While there are certain general principles applicable to and, to a certain extent, governing the designs of all sea-walls, yet, as will be shown, the details are allowed a large amount of latitude. This diversity is inevitable, as must be admitted when the varying conditions attending each individual case are taken into consideration, and separately allowed for. An elevation of a part of the wall is shown in Fig. 1, a plan in Fig. 2, and a cross-section in Fig. 3. The chief factor in determining the principal dimensions to be assigned to a sea-wall is the rise and fall of the tide, or the difference between high and low water mark. As a rule, along the top of the wall there runs a road, a footpath, or a track of some description, and the height of these above the sea level exercises a very important influence upon the height of the structure itself. In addition, the configuration of the foreshore, its rate of declivity, the nature of the material, and the character of the immediate substratum are all physical features and conditions which demand careful attention, and the exercise of much skill, judgment, and discretion. On referring to the cross-section in Fig. 3, it will be seen that the wall might be regarded as consisting of two parts—namely, the shore and the sea parts, the former comprising the portion above high water, and the latter that below the same datum. Provision must also be made for the increased height of water due to the action of violent storms, termed the flood-water level, and there are numerous examples of sea-walls built of very different materials failing from the neglect of this precaution. It is by no means an easy matter to obtain authentic and reliable information respecting the highest tide which has occurred in any particular locality, whether due to the normal

rise and fall or to the effect of exceptionally violent gales. Very little dependence is to be put in the testimony of the "oldest inhabitant," who has often a great propensity for exaggeration; nor in the level of the numerous objects indicating the heights to which the tide is stated to have risen at different periods.

Another distinction might be made between the two parts of the wall in the example selected in Figs. 1, 2, and 3. The part extending from the parapet *a* to the inner row of piling *P*, may be considered as the wall proper, since it is in every sense a regular retaining wall. But the remaining portion situated between the two rows of piles *P*, and *P* has no retaining duty to perform. It acts in some measure as a base to the shore part of the wall, but it is in reality an "apron," which is an adjunct to weirs, sluices, and numerous other examples of hydraulic works. After the piling is finished, the excavation taken out, and the trenches and backing filled in with carefully and well-rammed concrete, the facing of stonework and the building of the parapet wall completes the undertaking. While almost any hard good average type of building stone may be used for the facing, it is very common in Holland to employ blocks of basalt or of trap roughly cut and dressed and set in cement and breaking joint, as shown in Fig. 3. Trap, greenstone, and basalt are all unstratified metamorphic rocks, and are composed of crystals of a granular character of hornblende or augite in combination with feldspar. The grains in trap are much smaller than in granite, and those in basalt are so minute that they are in some specimens hardly visible. If these two descriptions of stone were not as a rule almost destitute of cleavage, they would constitute excellent constructive materials, as they are hard, tough, strong, compact, and durable. But this defect renders them difficult to tool, and, as a matter of fact, they are practically unknown here for building purposes. Trap is readily broken into small sizes, and it is worth mentioning that it has been extensively employed in protecting the western shore of the Hudson River in the neighbourhood of New York. It is also much used for paving, and when reduced to suitable dimensions for "setts," it is sometimes termed "Belgian block." Basalt differs from trap inasmuch as it generally tends to assume a columnar form. Splendid examples of this type of formation are to be seen at the Giants' Causeway in the isle of Staffa in Ireland; in Fingal's Cave on the west

FIG. 3.

coast of Scotland; and in "Samson's Ribs" in the vicinity of Edinburgh.

Referring once more to Fig. 3, it will be seen that the profile of the upper part or wall proper is that of a true circle, being struck with a radius which varies with the height of the wall, and the amount of circular "batter" it is intended to give it. In the figure, *b b b* are granite courses, the uppermost one acting as a through or bond course and also a longitudinal string course as well. In our next and concluding article we shall describe and illustrate a few more examples of sea walls existing in different countries. It may perhaps be mentioned, *à propos* to our subject, that the records of recent gales in the United Kingdom have abundantly demonstrated the necessity and the importance of such protective works as river- and sea-walls. T. C.

It was reported at the meeting, on Tuesday, of the ecclesiastical trustees of St. George's Church, Liverpool, that the Bishop of Liverpool, to whom had been referred the question whether the tower and spire should be removed with the body of the structure, had decided in favour of retaining the tower and spire. The bishop's decision was accepted, and the trustees proceeded to consider tenders for removing the body of the church.

\* See BUILDING NEWS, April 29, 1898.

## A MEDIEVAL WEATHERCOCK.

SO long ago as A.D. 1474 a certain ecclesiastic, of West-country family and birth, endowed probably with more than usual intelligence and suavity of address, was fortunate enough to be made private secretary to King Edward IV. This appointment proved the stepping-stone to success, for some two years later we find him Dean of Windsor. After adorning this office for little more than another year, Peter Courtenay—for such was his name—was appointed Bishop of Exeter, being the twenty-fourth in succession. Bishop Leofric (the Leoricus of Domesday), who died Feb. 10, 1072, was the first Bishop of Exeter. It is recorded that Courtenay ruled the diocese with great wisdom from A.D. 1478 to A.D. 1486. Some two years before his death he accomplished a long-desired ambition, and that was the "swapping" of some five Devonshire bells of moderate size for the big one at Llandaff Cathedral, which latter weighed no less than 60cwt, and is credibly affirmed to have been, at that time, the third heaviest in the kingdom. Thus he acquired "Peter," for by the familiar Christian name of its foster-father it has been known from that day to this. "There goes Peter!" is the common local expression when the hour is struck upon it (it is never rung!), or at eight o'clock in the evening, when the curfew will be tolled to-night upon it, just as it has been in this city every night since William the Conqueror's time.

In due course his prize was brought away, by road, to the Welsh Coast, then across the Channel to Clovelly, or Ilfracombe, and by land again to Devon's capital. Bishop Courtenay superintended its hoisting up on to the northern tower of the cathedral, one of the two Norman ones built by Warelwast, the third bishop (and the blind nephew of William I.), who was consecrated A.D. 1107, and died exactly thirty years later. This tower and its companion one upon the south side do sturdy duty as transepts to the 14th-century nave and choir. This arrangement of tower-transepts is, of course, a rare one. We find it locally copied in miniature at Ottery St. Mary in this county. There the church of St. Mary is practically a lesser fac-simile of our cathedral here. Its creation is ascribed to Grandison, seventeenth Bishop of Exeter (A.D. 1328-1366). I have seen the same sort of arrangement at St. Stephen's, Vienna, where the southern tower is capped by an exceptionally tall spire. It is 453ft. high—i.e., 49ft. higher than that of Salisbury, which measures 404ft. Both the Exeter towers were low as compared with the altitude of the roof-line of the cathedral itself, which is an unbroken one from stem to stern—or, rather, from east to west—of Exon's nave and choir (312ft. run). This grand stretch of roof line is in one place still finished by part of the original ornamental lead ridge cresting, the only example of lead cresting still existing upon any cathedral in the country. The big bell when hoisted was not hung within the actual line of the tower roof, but, probably to assist the sound, just above it. Further, to give more dignity to both towers, battlements of the then usual 15th-century character were added.

In this matter of parapets, Courtenay was undoubtedly acting according to Cocker. For, about the same date, were not the well-known Saxon western tower at All Saints, Earls Barton, in Northamptonshire; the circular Norman tower of St. Nicholas Church, at Little Saxham in Suffolk; the Early English one appertaining to All Saints at Middleton Stoney in Oxfordshire, and many others—space does not permit us to quote—treated in exactly the same manner? To protect the huge bell from the weather, a low spire of oak, covered, like the cathedral's roof itself, with lead, was erected around and over it. This steeplet terminated with a metal vane, surmounted by a weathercock of cast copper. The whole of this work—so the Fabric Rolls preserved in the Cathedral Library state—were satisfactorily completed in A.D. 1484. After this, as years flew, men came and men did go, but all went on the same with this particular tower and its bell-turret. At length, however, full 200 years later—to be exact, upon the 25th of November, 1703, Bishop Trelawney ruling the diocese at the time (less than four years later Queen Anne translated him to Winchester)—Devonshire was visited by a mighty storm—a perfect hurricane! One of the results of this tempest was the ripping up by the force of the wind of the lead covering this dwarf spire. Although duly repaired afterwards, the weakness then shown suggested so

much future instability, that during Bishop Levington's rule, and upon the 25th of April, 1752, the great bell was lowered many feet, so as to hang well beneath the level of the tower roof; then the spire above and its attributes were removed. So thoroughly were marks of its very identity eradicated that when, through the interest of the Society of Antiquaries, a superb volume upon Exeter Cathedral was written by C. Lyttelton and illustrated by John Carter, A.D. 1754—i.e., only two years later—not the slightest suggestion of any recently-existing spire can be gleaned from its pages. After this, for sixty years in all, the discarded vane, snugly stowed out of sight, but never once forgotten, rested from its labours within the precincts of the old Cathedral.

Without the city walls, within sight, and three minutes' walk (in those days) from the ancient East Gate, ruthlessly destroyed, alas, in A.D. 1784, by Exon's vandalistic citizens, stands—all that is left of it—the ancient parish church of St. Sidwell. Its patron saint, like the maidens who still, by their presence, brighten the parish, was a virgin fair to see, a daughter of a noble Briton named Banna, resident at Exeter. A jealous stepmother induced a degraded serving-man, during hay-harvest in A.D. 740, to cut off the ill-starred girl's head with his scythe. To do this wicked act the better, he caught her unawares from behind in the naps of the neck, whilst kneeling in the act of prayer by the side of a holy well not far removed from the top of what is at present my own orchard.

Soon after this murder a church was erected near the spot to mark and perpetually record the story of martyrdom. Of the earlier churches upon this site we unfortunately know little or nothing; but it is on record that the 15th-century tower was much injured and its upper part wholly destroyed by an explosion of some gunpowder stored therein during the Rebellion of A.D. 1549. It was at that time, too, its belfry was converted into a prison by the Royalists. Amongst the prisoners at one period in bond there was Walter Raleigh, father of the world-renowned Sir Walter Raleigh. The latter, most readers will recollect, was born (A.D. 1552) at Hayes Barton, a farmhouse in the parish of East Budleigh, a village situated some eleven miles south-east of Exeter. This tower and the exterior walls of the church were of red sandstone, quarried at Heavitree, an Exeter suburb. When the ruined parts of the dismantled tower were repaired in A.D. 1606, a brown-red coloured local brick was used. Some time later, probably when the present century was young, stone and brick alike were thickly stuccoed over with Portland cement.

This tower is seen to some advantage from my lawn, and when clerical friends from afar favour me by a visit, the structure generally forms one of the topics of conversation. Thus, some time ago, a venerable archdeacon resident in the largest city in England (the city of London, of course, is by no means the biggest) was my visitor. The fact had been mentioned that once upon a time in the old belfry, the father of Sir Walter Raleigh was confined, when turning suddenly, and with a bland look of intense interest, the grave old gentleman inquired drily: "Really!—may I ask, was it twins?"

Now it came to pass that in A.D. 1812 the general fabric of St. Sidwell's Church having fallen into grievous and irreparable decay, the edifice was, in the main, rebuilt, from the designs of the late Mr. William Burgess, architect, of Exeter. The north and south Early 15th-century arcades, each of five bays, cunningly wrought and carved in Beer stone, and the aforementioned tower alone were preserved. To the tower itself a spire was added—spires are unusual upon old West-country churches—rising to an altitude of 145ft. It was framed of deal, boarded and covered by sheet copper, which particular metal, a short time previously, had been removed from the bottom of one of Nelson's old men-of-war broken up in Devonport Dockyard, after doing brilliant service in the maintenance of England's prestige upon the high seas. Further, as luck had it, the Dean and Chapter of Exeter are the patrons of St. Sidwell's, and so, as a terminal for their new spire, the "Grecians"—as the parishioners of St. Sidwell have been called from time immemorial—received from the Chapter an acceptable gift in the form of the cathedral's ancient vane and its attendant chanticleer. So, after a long rest, the good old weathercock once again appeared before

the eye of a critical and inquiring public, and for a second period of time became the most truthful indicator of which way the wind blew within or without the city. From that day—always doing its work well—it continued in position until the evening of Tuesday, the 2nd of the present month, when, its supporting spire being condemned as unsafe by Mr. E. H. Harbottle, the cathedral architect, history repeated itself, and it was again lowered and brought to mother earth.

The opportunity of securing the lines of so illustrious a bird was too good to be lost; so, upon the morning after it was taken down, a photograph was obtained of it by one of my sons (H. Turner Hems), of which we give a reproduction.

The bird is of copper, cast in two pieces; these are soldered together around the edges. The squat, ungainly-looking legs rest upon an inverted cup of brass. The latter, when *in situ*, revolved upon a circular-topped projection in the actual wrought-iron vane; the steadying spindle being carried up through the legs and into the body, exactly 12in. above the cup. The bird measures 2ft. 9in. from the point of the beak to the extreme outside curve of tail. Its height above the cup is 2ft. 6in., and its greatest thickness—it is hollow—is 8in. The hollow base at the feet of the bird is not original. At first all was, undoubtedly, one casting. But the copper cup ultimately proved too soft a material for the iron it revolved upon, and so, by the constant, we may say, perpetual friction, became greatly worn; so, probably at the refixing in 1812, a hard brass (turned) cup was substituted. This somewhat clumsily applied addition possibly accounts for the present shortness of leg exhibited by our *rara avis*. First erected upon the cathedral spire A.D. 1484, this old weathercock did continuous service there for 263 years. Afterwards it did duty at St. Sidwell's for 87 years, giving a total of 355 years' actual service. Adding to this the time it remained idle, it is now, we see, 415 years old.

When the contemplated renovations to the tower are completed, it will, with the equally ancient iron vane,\* be once again re-hoisted to the top of the tower. Then it will be every whit in as sound a condition as it was in that far-away day when the 15th-century metal-smith first looked upon his own finished creation, and pronounced it to be good.

This record would be distinctly incomplete if unaccompanied by a few particulars relative to the removal of the actual spire itself. The work was smartly effected without the aid of any scaffolding by Charles Frederick and Edwin Reynolds, assisted by a couple of handy labourers, all four being residents in the parish of St. Sidwell's. The task was begun and finished in the comparatively short space of seven days. The Reynolds's are a family of local builders; their father, David Reynolds, and his father before him, old Richard Reynolds, have successively followed the same avocation within the shadow of the spire, and all three generations in succession have, from time to time, done necessary work at the church with commendable care and despatch. The accompanying series of litho-photos will best show the progress of demolition. They were all taken from precisely the same point of view by my son. Fig. 1 shows the untouched spire as it unconsciously stood upon the morning of the 2nd inst.; Fig. 2, the 4th inst., the work in hand; Fig. 3, as it appeared on the morning of the 8th inst.; Fig. 4, the 9th inst., nearly all down; and Fig. 5, Wednesday, the 10th inst., the task completed.

And now, good reader, my own task is completed too. I may, however, add, the rough-cast that has for so long covered and disfigured the tower has all been removed.

Exeter, May 18, 1899.

HARRY HEMS.

Lord Welby, Chairman of the London County Council, opened last week the annual free exhibition of pictures at Bermondsey Settlement. In all there are 175 pictures on the walls, among the more important being "Love Triumphant," by G. F. Watts, R.A.; "Cattle at Dawn," by Sidney Cooper; "Solitude," by Lord Leighton; "A Devonshire Orchard," by John Collier; "The Wide, Wide World," by Frank Holl, R.A.; "Naworth Castle, Cumberland," by the Earl of Carlisle; "A South Wind," by Sir E. Burne-Jones; and "Waiting," by V. C. Prinsep, R.A.

\* A sketch of this vane (carried up some 6ft. above the apex of the spire) we hope to give in an early number.

The Weathercock on St. Sidwell's Spire. Made A.D. 1484.  
Lowered May 2, 1899.

ST. SIDWELL'S TOWER AND SPIRE, EXETER.

## THE SURVEYORS' INSTITUTION.

At the ordinary general meeting of the above Institution, held at their temporary premises in Savory-street on Monday, an interesting paper was read on the system of "Land Purchase in Ireland," which, coming from a member so well qualified to speak on the subject as Mr. R. M. D. Sanders, of Charleville, was of especial value as showing the effects of recent land legislation on the prosperity of agriculture in Ireland, and the difference which existed between the Irish and English systems of tenure of land. The present system, inaugurated by Mr. Gladstone in 1881, had, the author said, few friends, but was condemned by landlords and tenants alike. The economic loss was great, for every fifteen years a number of lawsuits arose on the question of rent revision, which, although giving employment to a large number of solicitors and valuers, impoverished the litigants; and, beyond this, lands were designedly ill-cultivated for several years before the periodical rent-fixings, in order to secure low rents. There was thus created a feeling of unrest and uncertainty, and a complication of the relations between the two great classes interested in the land. It surpassed, the author believed, the wit of man to say what was really a "fair rent" in Ireland within the meaning of the Land Acts. The administration of Mr. Balfour's Land Act of 1896, which, on the whole, discouraged tenants from adopting land purchase as a settlement of the question, necessitated the appointment of Sir Edward Fry's Commission, of which the President of the Institution was a member. This commission issued a valuable report, and it was to be regretted that its recommendations had not been adopted by the Government. The author argued that all compulsory purchase was not only unnecessary but undesirable, for what was wanted was a return to the true principles of free contract as the only basis of a voluntary system of purchase. Compulsory purchase or sale must be founded on an official valuation which would not satisfy all parties. Present methods should be improved rather than new experiments made, for tenants were quite willing to buy and landlords to sell, while the Land Commission had plenty of money to lend; but the process was expensive, slow, and uncertain. The author proceeded to give details of the gradual development of the system of land purchase, from its origin in the Bright clauses of the Act of 1870. The total rental of agricultural land was about ten millions per annum, paid by about half a million occupiers, three-fourths of whom paid less than £15 per annum. Up to the end of the last financial year some 3½ millions of land stock had been issued, and nearly 10,000 occupiers, paying a rental of £190,000, converted into owners. The advantages of the system to both landlord and tenant were great, the tenant becoming fee-simple owner, subject to a Government terminable annuity very much less than his rent, even when he agrees to pay his landlord a liberal price, and reducible every ten years, in proportion to the amount of principal paid off. Interest was payable at the rate of 3 per cent. per annum until the next "gate-day," and afterwards at the rate of 4 per cent. in half-yearly instalments in November and May, £2 15s being used to pay dividends on the land stock, and £1 5s. treated as capital repaid, to be accumulated at compound interest as a sinking fund, the amount of interest payable being recalculated every ten years on the amount of the advance still outstanding. Mr. Sanders gave interesting tables showing how this procedure worked, and warmly advocated some system of registration of title by which the transfer of land could be more easily effected.

A discussion followed, in which Mr. Watney, who much doubted whether the system of land purchase, however good for the individual, was good for the country at large. Mr. J. H. Sabin and the President took part, the latter speaking from his experience as a member of Sir Edward Fry's Commission, expressing a doubt whether the valuers who were appointed to fix the basis of fair rents were always competent to do this business, and giving it as his opinion that the interference with freedom of contract which underlay all these land Acts had ruined Irish agricultural property, and if introduced into England—and there were signs of its being attempted—would work equal havoc here.

New schools are being erected at Nuneaton, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

## Building Intelligence.

BRADFORD.—Lady Powell laid, on Monday, the foundation-stone of a new church in Grange-road, Bradford, to be known as the Church of St. Columba. The style is Early English, and the nave will be 79ft. long and 24ft. wide, with aisles on each side 11ft. 6in. wide, from which there will be projecting transepts. At the west end there will be a vestibule about 8ft. deep with a similar width to that of the nave. On the north side of the chancel will be a chapel 35ft. by 17ft. On the south side is the organ chamber. A staircase will lead to the basement, which will be furnished as parish rooms. The church will be built of local stone, with a roof of Westmoreland slate, and will have a turret which will be 65ft. high. The architects are Messrs. T. H. and F. Healey, of Bradford.

BRISTOL.—The plans prepared by Messrs. Jones and Cummings, whose designs for the rebuilding of the recently burnt Colston Hall were selected in competition, have been approved of by the Seating Committee. The site has been lengthened nearly a third, from 112ft. to 168ft., by the purchase of adjoining property, and the exits and entrances will be greatly improved, while the floor space will be unobstructed by columns, the gallery girders being carried on the cantilever principle. The seating accommodation of the new hall in round figures will be 4,000. On the ground-floor will be room for 1,614, in the grand tier for between 600 and 700, in the gallery for 1,000, and on the orchestra for between 676 and 700. The former Colston Hall accommodated, in the ordinary way, about 2,600 persons.

HAWARDEN.—The County School was formally opened on Friday by Miss Helen Gladstone. The building contract was £2,450, exclusive of extras. The red brick buildings, on the main road through Hawarden, consist of two central classrooms. To the west of this block is the boys' wing, consisting of the headmaster's room, classrooms, and laboratory, with the coat-room, lavatory, and boys' porch. To the east of the centre is the girls' department, while to the south of the central block is a luncheon-room and kitchen. Externally the walls are of red Ruabon bricks, with dressings and mullioned windows of red terracotta, from Mr. J. C. Edwards's works, and the roofs are of red Ruabon tiles. The schools accommodate 54 boys and 44 girls. The architects are Messrs. Grayson and Ould, of Liverpool, and the contractors Messrs. W. and T. Bailey, of Hawarden.

KEIGHLEY.—The Queen's Theatre and Opera House is being entirely reconstructed from the plans of Mr. F. Matcham. The elevation in Queen-street will have a frontage of 83ft. The auditorium will be 56ft. by 60ft., and the whole interior, circles and all, will be constructed of fire-resisting material. The cantilever principle has been adopted. The stage dimensions are 65ft. wide and 45ft. deep. The stage itself will be on a level with Adelaide-street. From floor to grid the height will be 60ft. The style adopted will be the French Renaissance. Electricity will be employed for lighting purposes, but gas will be laid on as a reserve. The building will be heated on the low-pressure hot-water system. The contracts have been let to Messrs. Greenhow and Murgatroyd, builders, of Keighley.

MANCHESTER.—New St. Mary's Hospital for women and children is now in course of erection in Oxford-street and Gloucester-street, from designs by Messrs. Alfred Waterhouse and Son, of London. The main front of the hospital, 280ft. in length, which is broken into by a deep courtyard, faces south to Gloucester-street. The Oxford-street frontage is only 25ft. in width. Accommodation is arranged for out-patients upon the ground floor, in waiting-rooms and examination-rooms placed near the dispensary. The general entrance to the hospital will be in the centre of the south courtyard. The accommodation is divided throughout the building into two portions; each portion is distinct, and will be furnished with separate entrances, staircases, and lifts. On the ground floor are the out-patients' rooms, lecture theatre, chapel, mortuary, museum, and residential rooms. The wards commence upon the first floor, although the circular pavilion, utilised for ward purposes on the second floor above, there will be accommodation for twelve beds, in a perfectly circular room, with a diameter of 43ft. This room will be surrounded on all

sides by windows, interrupted only by the entrance and the bridgeway to the sanitary tower. There will be another precisely similar ward upon the third floor, but on the first floor the space is apportioned for dormitories for nurses. On the east side of the hospital there will be on the first floor a rectangular ward for twelve beds and three or four separate wards for one or more beds. On the same floor will be the boardroom and the library, which will extend to the second floor. The fourth floor will contain the servants' rooms, kitchen, scullery, bakery, larders, and stores. The main walls are to be faced with Accrington red bricks, relieved by terracotta and by moulded strings and cornices. The new hospital will be fitted for 125 patients. The contractor is Mr. Vickers, of Nottingham.

NEWPORT, I.W.—A public meeting was held at the Guildhall, Newport, Isle of Wight, to consider what steps could be taken for the restoration of the external fabric of St. Thomas's parish church. A report on the condition of the church, prepared by Mr. J. B. Colson, of Messrs. Colson, Farrow, and Nisbet, of Jewry-street, Winchester, and New Court, Carey-street, W.C., was read, stating that parts of the wall at present of Caen stone ought to be repaired with harder material, preferably with that from the Chilmark quarries. The cost of the necessary repairs was set down at £3,000. It was decided to proceed with the work as indicated in Mr. Colson's report. A restoration committee was appointed, and liberal donations were offered in the room.

PETERBOROUGH.—The foundation-stone of the new church of St. Barnabas, at Sexton Barnes, at the northern end of the city, was laid a few days since. It is proposed to build a church to accommodate 500, and the present contract with Messrs. John Thompson and Co., Peterborough, is for £3,500, which will provide the chancel, vestries, organ-chamber, transepts, and three bays of the nave. The plans have been prepared by Mr. W. Boyer, architect, of Peterborough. The church will consist of sanctuary, chancel, choir and clergy vestries, with organ-chamber over, north and south transepts, nave of five bays, and at the western end a baptistery, whilst a tower will ultimately complete the work. The church is designed in the Late Decorated style.

REDRUTH.—Mr. J. Passmore Edwards opened, on Thursday in last week, the Children's Jubilee Memorial Wing, which has just been added to the West Cornwall Women's Hospital. The wing has a south-west aspect, with an extensive view. The large ward upstairs, which is furnished with six beds, is lit by four windows. A room for a nurse adjoins, and on this floor are also bathroom, lavatory, &c. On the ground floor are the children's day-room for young convalescents, a room for wardmaid, and a ward for special cases. Mr. Sampson Hill is the architect of the new wing, and the contract has been carried out by Messrs. T. Opie and W. C. Hodge.

Colonel J. T. Marsh, R.E., held an inquiry in the National Schoolroom at Shadwell on Friday into an application by the Wetherby Rural Council to borrow £2,000 for sewerage and sewage disposal.

A new turret striking clock, showing the time upon three external dials, was set going on Wednesday, at St. Clement's Parish Church, Bradford. The clock was made and fixed by Messrs. W. Potts and Sons, clock manufacturers, Guildford-street, Leeds, and Newcastle-on-Tyne, and the builders work by Mr. Newell, Bradford.

An addition to the Montrose Lunatic Asylum, Carnegie House, erected for the reception of forty private patients, was opened on Monday. It consists of a central block, containing public hall, dining-room, and administrative room, and two wings of two floors each, and has cost £20,000. Mr. William Kelly, of Aberdeen, is the architect.

A memorial was unveiled on Tuesday in the village of Llansannan, of five famous Welshmen, natives of the parish: Tudor Aled, born 1470, a Franciscan monk and poet; William Salesbury, born 1514, who achieved distinction as the translator of the New Testament into the Welsh language; Henry Rees, born 1797, an eloquent preacher in the Welsh Calvinistic Methodist Denomination; William Rees, his brother, politician and literateur; and Edward Roberts, a Methodist minister and writer of Welsh poetry. The memorial consists of a bronze figure of a little girl, seated at the foot of a granite obelisk, dressed in a Welsh costume; she is weaving a garland. It is the work of Mr. W. Goscombe John, A.R.A.

FOUR INTERIORS FROM AN ARCHITECT'S HOUSE AT NOTTINGHAM.—FRESCOES FOR GRAHAMSTOWN CATHEDRAL, SOUTH AFRICA.—AN AMERICAN ARCHITECT'S MEMORIAL (RICHARD MORRIS HUNT).—"CHARITY," BY GEO. FRAMPTON, A.R.A.—PROPOSED PALACE OF VARIETIES, KILBURN.—DESIGNS FOR A STABLE FOR A SUBURBAN HOUSE.

## Our Illustrations.

"WOODSIDE," CHILWELL, NOTTINGHAM.

I HAVE recently built this house for myself at Chilwell, near Nottingham. The site is on a hillside, with a range of view of 30 miles of the beautiful Trent Valley. The drawing and dining rooms and hall face the south. The former is adapted for a music-room. The walls are panelled in American walnut, and the floors are of oak and teak blocks. All the door furniture and plates are of beaten aluminium specially designed. The fireplaces are of the "well" type, with green glazed bricks and glass mosaic hearths. The dining-room and hall are panelled in oak, and the floors are also of oak and teak. All are lighted by electricity supplied from my own plant. Stuart's granolithic lattice floors form the foundation for the oak blocks, and I find them very satisfactory in every way.

ARTHUR MARSHALL.

FRESCOES FOR GRAHAMSTOWN CATHEDRAL, SOUTH AFRICA.

A SERIES of ten frescoes have recently been affixed to the chancel walls of St. George's Cathedral, Grahamstown, South Africa. They have been painted by Mr. Oswald Fleuss, of 17, Cantlowes-road, Camden-square, London, N.W. We give two of the frescoes illustrating "The Resurrection" and "The Journey to Emmaus." The others represent: "The Baptism of the Eunuch," "Christ and the Seven Lampstands," "Appearance to the Apostles," "Feed My Lambs," "The Appearance in the Garden to St. Mary Magdalene," "Confirmation in Samaria," "The Day of Pentecost," and "The Ascension."

AN AMERICAN ARCHITECT'S MEMORIAL, NEW YORK.

THE late Mr. Richard Morris Hunt, R.I.B.A., Gold Medallist in 1893, the architect of the Administration Building of the Chicago World's Fair, was one of the most popular architects in the United States. He designed the Vanderbilt mansions at New York and Baltimore, and a similar house for Mr. Jacob Astor, not to name others of a like kind also erected at an almost unlimited cost. His municipal and public buildings are too numerous to name here, and his Pelasgic-like monument, the Delano Tomb, New Bedford, Mass., may be quoted as an instance of plain and broadly-treated memorial architecture from his facile pencil. He was president of the American League of Architects, and the monument which has just been erected to his memory in the Fifth-avenue, New York, shows how highly his personality as a citizen and reputation as an architect are esteemed by his contemporaries. The design is by Mr. Bruce Pryce, and Mr. Daniel C. French, of New York, is the sculptor.

The composition is an exceedingly dignified and handsome piece of work, very reserved in design and severe in style. The bust portrait is a remarkably good one, as our readers may see by referring to the BUILDING NEWS for June 16, 1893, when we gave Mr. Hunt's photograph, with an account of his career. For the photographic view reproduced to-day we are indebted to the *American Architect*.

## "CHARITY."

MR. FRAMPTON'S work "Charity" is a posthumous portrait of a lady. The tablet itself is composed of white marble, with coat of arms slightly coloured. The frame is very rich, and made of different marble, surmounted at the corners by two white metal figures of young boys. The work was executed for and is placed in a church. Our photograph was taken by the Bolt Court Art School, Fleet-street.

## KILBURN PALACE OF VARIETIES.

THIS plate illustrates the design of a proposed new Palace of Varieties, which is about to be commenced, with some slight modification in the elevation, on the site of the existing Theatre Royal, which is fully licensed as a theatre and music-hall, and which will also absorb the adjoining property known as Barnes' Depository. The property will have a frontage to Belsize-road (facing Kilburn station, L. and N. W. Ry.) of 82ft., and to Kilburn Priory of 89ft. The interior will be constructed on the cantilever system without columns, proscenium opening 30ft., width of stage 64ft., and depth 31ft. The latest fire appliances will be used, and the building will be lighted by electricity. Messrs. Palgrave and Co., of Victoria-street, S.W., are the architects.

"BUILDING NEWS" DESIGNING CLUB: STABLES FOR A SUBURBAN HOUSE.

(For description and awards see p. 704.)

## CHIPS.

THE Prince of Wales will lay the foundation-stone of the new buildings of the Royal School of Art Needlework, at the corner of the Imperial Institute-road, South Kensington, on Friday, June 23, at four o'clock.

THE Prince of Wales has also intimated his intention of laying the foundation-stone of the new Post Office Savings Bank buildings, to be erected on the Olympia annexe, in the parish of Hammersmith.

MR. W. E. H. Newham, who has for upwards of twenty years represented the Midland Railway Company in the estate department for the Manchester and Liverpool districts, has been appointed to the London agency in succession to the late Mr. Buxton.

FOR the New York Custom House, which is to be one of the most important buildings ever erected by the United States Government outside of Washington, competitive designs have been invited from a limited number of architects from New York, Boston, Philadelphia, and Chicago. The number of invited competitors is twenty, and the building is to cost about \$800,000 sterling, or four million dollars.

THE Primate will officiate to-morrow (Saturday) at the laying of the foundation-stone of the new Archbishop's Palace adjoining Canterbury Cathedral.

THE Duke and Duchess of Connaught will open the hospital erected at Woodford, Essex, to commemorate the Diamond Jubilee, on June 1. The Lord Mayor of London and Sheriffs will also be present. An Endowment Fund has been generously subscribed for by the inhabitants of the neighbourhood, and Mr. J. R. Roberts, of Woodford, kindly presented the land, hospital, and all internal fittings. The architects are Messrs. J. Kingwell Cole and Kenneth Wood, A.R.I.B.A.

THE parish church of Eyke, East Suffolk, was reopened last week after restoration, including underpinning the chancel walls, reflooring the nave, retiling the Communion space, and the erection of vestry on the north side of the nave. Mr. A. E. Kersey, of Great Bealings, was the builder.

A Local Government Board inquiry was held at Liverpool on Wednesday at the municipal offices as to borrowing £50,000 for the purposes of the Liverpool Sanitary Amendment Act, 1864, and £13,500 for the provision of dwellings for persons of the working class, &c.

THE Duke of Portland on Tuesday opened a new school for 350 children at Cresswell, a village within two miles of Welbeck Abbey. Subsequently he laid the memorial-stone of a new church, now in course of erection in the same village, at an estimated cost of £5,000.

## THE DISPUTE IN THE BUILDING TRADE.

THE representative meeting last week at Birmingham decided, as we stated it would in our last issue, to meet the plasterers in conference. The decision was arrived at in spite of considerable opposition on the part of some of the Yorkshire employers, who appear hardly to grasp the situation. The London employers seem to us, with one or two exceptions, to have very admirably hit the happy mean between obstinacy and timidity. To Mr. Greenwood especially, of the well-known firm of Holliday and Greenwood, both masters and men will be greatly indebted for a happy issue which has taxed an exercise of tact and firmness as uncommon as it has proved beneficial.

THE improved conditions generally, which we are sanguine enough to hope for from the results of next week's conference which will be held in London on Tuesday next, will reflect honour on all concerned. We shall have more to say about these next week, and shall not omit to pay a well-deserved tribute to the able and well-intentioned intervention which has avoided a rupture. We must say, however, that no intervention of the sort could have been possibly effectual if the employers represented at the Birmingham meeting had not faced matters generally with such statesmanlike comprehension.

WE need not here repeat the lines on which the dispute will be settled. We indicated them last week, and need only say now that the very difficult point about foreign "blackleg" labour has been solved in a fashion as just as it is diplomatic. The other matters at issue will be settled as we foreshadowed in our last issue.

## COMPETITIONS.

COATDYKE, AIRDRIE, N.B.—The result of the adjudication upon the competitive plans for the new elementary school at Coatdyke, to be erected by the Airdrie School Board to meet the demands of the rapidly growing population, is that the plan by Mr. James Shaw, architect, Coatbridge, has been chosen, that of Mr. William Shanks, Airdrie and Glasgow, being awarded the second place and premium of £10.

YARLEY.—At Tuesday's meeting of the Yardley Rural District Council, the general purposes committee recommended that Mr. Arthur Harrison's plans and amended estimate for the proposed new depot, public offices, fire-station, and mortuary at Sparkhill should be finally approved, except that portion relating to the tower, which should be dispensed with. Mr. Griffin expressed surprise that such a recommendation should come from the general purposes committee after the board had instructed them to reopen the matter and to ask the architects who had entered into competition to again send in their plans. He complained that they were spending £3,000 or £4,000 more than was necessary, and simply on "outside show." Mr. Griffin moved that the matter should be referred back to the committee for reconsideration. The architect's revised estimate for the work, he said, was £9,750, to which had to be added about £700 or £800 for architect's commission. They had not taken into consideration the heating of the building, and altogether they were going to spend £11,000 or £12,000. He considered that it was most unfair to the architects. The committee had allowed one architect to send in a revised estimate of nearly £2,000 extra without giving the others any chance. Mr. Plater moved as a further amendment that the plans should be accepted in their entirety. After further discussion, the recommendation of the general purposes committee was adopted, and it was decided to appeal to the Local Government Board for sanction to borrow £11,000 for the erection of the new buildings.

THE foundation-stone of a public hall was laid at Pitlochry, N.B., on the 18th inst. It will be Scottish Renaissance in style, and will contain a concert-room 60ft. by 33ft. 6in., seated for 500 persons, while 90 other seats are provided in a gallery. Mr. J. R. D. Swan, of Blair Atholl, is the architect.

MR. J. Passmore Edwards opened on Thursday, the 18th inst., the Helston Science and Art School, to which he has been a liberal donor. Mr. Edwards gave the building, at a cost of about £1,600, and the furnishing was carried out with local subscriptions and a grant from the County Technical Instruction Committee.

## OBITUARY.

We regret to announce the death of Mr. CHARLES BELL, F.R.I.B.A., of 3, Salters' Hall-court, Cannon-street, E.C. Mr. Bell, who died on Monday at his residence, 3, Campden Hill-square, W., had had for many years an extensive chapel and school practice, especially among the Wesleyans, in which denomination he was a prominent layman. A native of Grantham, he was educated at the grammar school of that town, and having gained some experience in the office of his brother, a builder and contractor, he was articled to Mr. John Giles, of Craven-street, W.C. Soon after commencing practice on his own account he came to the front by winning many competitions. His work was of a varied character, including workhouses, infirmaries, cemetery chapels, board schools, mansions, houses, warehouses, markets, corn exchanges, and almshouses. Among recent large works were the Northern Polytechnic, Holloway-road, gained in competition, and the Passmore Edwards Holiday Home for Children, Clacton, illustrated in the BUILDING NEWS of May 20, 1898. Mr. Bell joined the Royal Institute of British Architects as an Associate in 1870, becoming a Fellow ten years later. We gave his portrait and biography in our issue of March 6, 1891.

## CHIPS.

The offices of the Surveyors' Institution have been removed this week from the temporary premises in Savoy-street, Strand, to the spacious new buildings erected for the Institution from the designs of Mr. Alfred Waterhouse, R.A., at 9, Great George-street, Westminster.

The Bishop of Durham opened the new premises of the Clergy Training School, Cambridge, on Thursday afternoon in last week. The site of the new building is opposite Jesus College. It is of red brick and stone, and is built from the designs of Mr. Ould, the architect who was responsible for the new buildings of Trinity Hall. The total cost is estimated at £7,600.

The town council of Huddersfield have raised the salary of their borough engineer, Mr. Campbell, from £500 to £600, with further increments of £50 a year to £700.

At Wortham, Norfolk, a new Wesleyan Chapel and schoolroom were opened last week. Mr. Isaac Osborne, of Diss, was the builder.

The Ealing Urban District Council have unanimously adopted a scheme for the erection of 120 municipal workmen's dwellings, and decided to purchase 6½ acres of land, at a cost of £5,200, for the purpose.

The foundation-stone of a Boys' Brigade hall was laid with Masonic honours on a site in front of the Madras College, St. Andrew's, on Thursday in last week. Mr. James Gillespie is the architect.

Mr. W. O. E. Meade King, M.I.C.E., has held an inquiry into the application of the urban district council to borrow £6,000 for a new water supply for East and West Loos.

At the annual meeting of the Llandudno Victoria Pier Company, Limited, last week, a contract with Messrs. Heenan and Froude was approved and sealed for the construction of a pier at Llandudno at a cost of £90,000. The pier will be 40ft. wide, and will be carried seawards from the centre of the bay, a distance of 350yds.

The Three Towns Branch of the Devon and Exeter Architectural Society have elected the following officers for the current year:—President, Mr. H. G. Luff, A.R.I.B.A.; committee, Messrs. M. A. Bazeley, C.C., J. H. Dwyer, Charles King, A. S. Parker, A.R.I.B.A., and W. N. Richards; hon. secretary and treasurer, Mr. B. Priestley Shires, A.R.I.B.A.

The new Marine Palace and Pier, which has been erected opposite the Aquarium, Brighton, close to the site of the old Chain Pier, was opened to the public on Saturday by the Mayoress of Brighton. The new pier is not yet completed, the pavilion having still to be built, but the portion opened to the public extends some 1,500ft. from the beach, and several smaller pavilions have been put up. Reading-rooms and dining-rooms are provided, also ornamental arches for electrical illumination purposes, and an electric tram runs up the centre of the pier. There are to be landing stages at the head of the pier with never less than 12ft. of water. The entire structure covers an area of two and a half acres, and 85 miles of planking and decking have been employed in its construction. The work is being carried out under the superintendence of Mr. John Howard, A.I.C.E., London, and Mr. R. St. George Moore, M.I.C.E. The ornamental ironwork has been executed by Messrs. Hart, Son, Peard, and Co.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLIX., LI., LII., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## THE PURIFICATION OF THE PROFESSION.

To the Editor of the BUILDING NEWS.

SIR,—Surely no better way can be found for the purification of the profession—referred to by your correspondent in the issue of last week—than that of electing to the premier architectural body men of such good standing and unquestioned probity as the candidate who has circularised us. His opinion on the admission of females to membership is one with which a large number of members agree, and I, for one, will give him my vote with the greatest of pleasure. But, Sir, the question of female members is only one of many others. We want new men who will awaken the older members of the Council from their slumbrous apathy and remind them of their duties to the Institute and the profession generally.

I think it is to be regretted that other candidates for election abstain from adopting means similar to this gentleman's circular for letting the electors know their opinions on current subjects. —I am, &c., J. H. C.

## VAUXHALL BRIDGE AT THE INSTITUTE.

SIR,—In your report of last week it is stated that, in answer to my request that Messrs. Mountford and Statham's design for Vauxhall Bridge voussoir lines should be published in the Institute Journal, Mr. Statham replied, "No,

he did not prepare designs for Mr. Woodward to criticise, and wrote his paper for quite a different class of person."

I am happy to say that Mr. Statham has relented, because he has published his design in the Journal. I say "his design" because I have too much respect for Mr. Mountford's power of design to think that he did more than "pass" this unique effort.

I could not, at the time, understand the savage manner in which Mr. Statham replied to my request; but I may now take the opportunity to explain that it was not for myself that I wished the design published—I had been gazing at it for an hour; but it seemed to me a pity that the world should lose so very fine an example of voussoir design—hence my anxiety that it should be placed on permanent record, and distributed over the four quarters of the globe.

I understand that a large and influential deputation will shortly wait upon Mr. Statham, and ask him to allow his design to be carried into execution, and had it not been that the illustrations in the Journal are copyright, I would have asked you, Sir, to permit its reproduction in the BUILDING NEWS. I may, however, briefly describe it for the benefit of those who do not see the Journal.

Mr. Statham's design is simplicity itself. He starts at the soffit line of the arch, and having spaced out the voussoirs, carries them right up without a single horizontal break to the "plinth line of the balustrade," because, as Mr. Statham explains in the Journal, "it would be a pity to lose the open balustrade." So it would, Sir, and I am one of the first to acknowledge it. The designer of the Waterloo Bridge voussoirs seems to have thought that the interposition of horizontal voussoir lines intersecting the arch voussoir lines gives strength and beauty to the bridge, and yet he doesn't lose the balustrade. How very curious! But then he was only a wretched engineer, and not a Member of Council of the Royal Institute of British Architects. Another charming feature of Mr. Statham's design is that his uninterrupted voussoir lines die into the vertical lines of his piers, producing that beautiful "flat appearance" which Mr. Statham says was his object. The effect, to me, is that the arch, at its haunches, is quietly slipping away from the piers; but then Mr. Statham "does not prepare designs" for the likes of me to criticise!

I do sincerely trust that the deputation referred to will prevail upon Mr. Statham to allow the embodiment of this unique voussoir design into the executed work. It will save the credit of the London County Council, it will enhance the value of No. 9, Conduit-street, and it will excite the envy of foreigners to such an extent that they will attempt to secretly blow up the bridge with dynamite.—I am, &c., WM. WOODWARD.  
13, Southampton-street, Strand, May 23.

## ARCHITECTS AND LOCAL AUTHORITIES.

SIR,—It would be a good thing, I think, if the discussion on the experience of architects in their relation to local authorities could be brought to some practical issue. Just now the local authorities of the town in which I live are particularly officious in the exercise of their power to disapprove of plans which they consider are an infringement of the by-laws. The latest move is to reject plans which show bay windows constructed of timber framing. They say it has recently been decided in a court of justice that a bay window is part of the outside wall of a building, and, therefore, the by-laws relating to the construction of external walls must be applied to bay windows. They require these for the future to be built of brickwork or stone or some other incombustible material. This appears to me very unreasonable, and I should like to know how other architects look upon such an interpretation. I am told by a barrister-at-law that a town council or railway company's by-law is bad! unreasonable. But what can be done in a case like this? If such an interpretation of the by-laws can be upheld, many architects, I am sure, will feel a keen regret in having to give up such a pleasing feature as a wood-framed bay so often is.—I am, &c., W. H. B.

A Presbyterian church is about to be built at Felixstowe, at a cost of £3,000, from designs by Mr. G. W. Leighton, of Ipswich. It will be of open area type, with transepts having single-span roofs of open timber construction. The walling will be of Kentish rag.

## Intercommunication.

### QUESTIONS.

[12241.]—**Rectory.**—A rectory is properly a spiritual living endowed with tithes; its secondary meaning is the parochial dwelling endowed with the living. Was the priest's house in pre-Reformation times usually called a "rectory" when the priest was in perception of the tithes in his own right? One or two authorities would greatly oblige.—L. V.

[12242.]—**Reservation of the Communion.**—In Anglican churches which are "high," and the consecrated elements reserved (presumably until immediately before the next consecration), where are they placed to secure them from profanation? I assume that there is no tabernacle as in Romish churches. Are they simply placed on the altar, or in a niche in the wall, and covered with a napkin, or taken away and locked up?—R. W. M.

[12243.]—**Casements.**—Which are the most weather-tight to use, wood or metal? If the latter, how can they be fixed to wood mullions? Is there not some way of rendering the meeting stiles of wooden casements water-tight by grooving the joint and frame, and how should the lower rail be formed to fit over the sill? Information will oblige.—A. D. I.

[12244.]—**Outlet of Closet.**—How should the short arm or outlet from closet through outer wall be formed and connected to soilpipe? What are the requirements of the L.C.C. as to making the connection and weight of pipe, &c.? I should esteem it a favour if anyone will reply.—BUILDER.

### REPLIES.

[12233.]—**Damp Basement.**—I should be inclined to use Callender's pure bitumen sheeting, applied either externally or internally. Send for particulars to Callender and Co., 11, Victoria-street, Westminster.—G.

[12238.]—**Quantities.**—Assuming that the houses are very similar in plan, "Peverill" should charge 2½ per cent. on the block of five. He can hardly charge on four blocks for taking off one; but for superintendence he can charge 2½ per cent. on the £2,000. About £75 would be a fair charge for drawings, specifications, superintendence and quantities.—H. LOVEGROVE.

[12238.]—**Quantities.**—Five per cent. for plans, specifications, and superintendence on £2,000, and an extra 1½ per cent. for quantities.—ROBT. H. M. ELM, E.E.

[12238.]—**Quantities.**—It would have been better if "Peverill" had arranged as to his commission. As the quantities are for houses of the same plan and construction, those taken for one block would apply to all the other blocks, with few exceptions as to foundations, &c. I should say a commission of 2½ per cent. on one block of five would be fair, or a reduction of 1 per cent. on the whole.—FAIR.

[12239.]—**Pitches of Roofs.**—In such books as Newland's "Carpenter's and Joiner's Assistant," the roofs given were in use at a time when it was necessary to make a roof very flat, so that it should not be seen above a more or less ugly parapet, and modern books have in many instances copied the old details. If "Excalibur" will take advice, his roofs will be made steep; nothing looks better, or is more suitable for use in this climate.—H. L.

[12240.]—**Modern Hotels.**—There are no books on the subject, which presents few difficulties, as it is easy to visit a few good buildings and note details of planning.—H. L.

[12240.]—**Modern Hotels.**—I do not think "Utility" will find any work dealing with hotel planning. As they vary so much in size and accommodation, any work on the subject would be misleading. It is the model plan that is wanted. Only an expert in hotel building is able to treat such a subject. The best plan is to visit a few well-appointed hotels here and abroad.—POSTULATA.

## Our Office Table.

IN connection with the formation of the proposed new street from Holborn to the Strand, the London County Council will be under an obligation to rehouse about 3,030 persons of the labouring classes who will be thereby displaced. By the Council's Clare-market scheme another 2,250 persons will have to be rehoused. For the two schemes, therefore, accommodation must be provided for 5,280 persons. Of these, about 2,000 are to be rehoused on the Millbank site, and the remainder upon sites in the vicinity of the new street. When the Council reassembles a proposal will be laid before them by the Improvements Committee for the purchase for £200,000 of a large portion of the site of Reid's brewery, between Gray's Inn-road, Clerkenwell-road, and Hatton-garden. Upon this site about 2,070 persons could be housed, and negotiations are taking place for the purchase by the Council, by agreement, of the whole of the site between Gray's Inn-road and Hatton-garden. On the complete site, which is within half a mile of the new street, it will be possible to accommodate 3,000 persons. If this scheme is carried out the two sites on the western side of Drury-lane, already acquired by the Council, will be exclusively set apart for accommodating workers in Covent Garden Market and for those whose hours are such as to necessitate residence in the immediate vicinity of the new street. If this is done, the site on the eastern side of Drury-lane south of Kemble-street can be dealt with for commercial purposes, and thus the Council will be enabled to acquire the Reid brewery site without exceeding the amount estimated for rehousing purposes under the two improvement schemes.

OWING to the success which attended the engineering conference organised by the council of the Institution of Civil Engineers two years since, a further conference will be held on Wednesday, Thursday, and Friday week, June 7, 8, and 9, in Westminster. The proceedings will be opened with an address by the president of the institute, Mr. W. H. Preece, C.B., F.R.S., in the theatre of the institution. The subjects for consideration will be divided into seven groups or sections, and will be discussed at three different meeting places which have been placed at the disposal of the council—namely, the Institution of Mechanical Engineers, the just completed Surveyors' Institution, and the Guildhall, Westminster. The subjects for discussion range over the whole field of engineering service and practice, and include railways, harbours, docks, canals, machinery, shipbuilding, mining and metallurgy, waterworks, gasworks, sewerage, and electricity. Each subject will be introduced by a short paper, which will be read by the author and discussed by the meeting. A number of visits to works of professional interest have been arranged for each day.

A SYNDICATE has been formed at Ripon for the purpose of carrying out extensive building operations, and to meet the increasing demand for villa residences, hotels, and hydros. Lord Ripon has sold two sites on the west of the city, the one being on the high ground overlooking the cricket-field on the Studley-road, and having a prospect in the direction of Studley Park. Here it is proposed to erect a large residential hotel, which will stand in its own ground of five or six acres, and where, if the corporation are successful in securing the Aldfield Spa, it is hoped sulphur water may be laid on to provide baths for visitors. The twenty-four acres of land purchased from Lord Ripon to the south of the cricket-field is to be laid out for villa residences, and eventually a new road in the direction of Studley may be opened between Skellbank and Bishopton, which would be an alternative route to Fountains Abbey for visitors from Harrogate. The numerous houses being erected in other parts of the city tend to prove that Ripon is steadily growing.

The preliminary contract has been signed for the Tientsin Chin Kiang Railway. The sum named in the agreement is £7,400,000, but it is liable to variation on the report of the surveyors.

At a meeting held on Friday night of the Belfast Cathedral Guild, in connection with the scheme for the proposed cathedral in that city, the Rev. Canon O'Hara stated that £16,000 had been already subscribed, that another £7,000 was needed, and that the foundation-stone would probably be laid in September.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. Annual Meeting at the New Building, 12, Great George-street, Westminster. 3 p.m.  
Royal Institute of British Architects. "Planning and Construction of Board Schools," by T. J. Bailey. 8 p.m.  
TUESDAY.—Society of Arts. "The Revival of Tradesmen's Signs," by J. Starkie Gardner. 8 p.m.  
WEDNESDAY.—Institution of Civil Engineers. Engineering Conference. Address by W. H. Preece, C.B. 10.15 a.m.  
Architectural Association Dinner, Holborn Restaurant. 7 for 7.30 p.m.  
THURSDAY.—Society of Arts. "The Port of Calcutta," by Sir C. Cecil Stevens, K.C.S.I. 4.30 p.m.  
Carpenters' Hall Free Lectures. "Decay and Preservation of Timbers," by Professor T. Roger Smith, F.R.I.B.A. 8 p.m.  
SATURDAY.—Northern Architectural Association. Excursion to Chester-le-Street and Lumley. Edinburgh Architectural Association. Excursion to Arbroath Abbey.

## THE ARCHITECTURAL ASSOCIATION.

JUNE 3rd.—VISIT TO COBBHAM HALL, KENT. Train leaves Victoria for Sole-street at 11.45 a.m., Holborn Viaduct, 11.40, or St. Paul's, 11.42. P.O. for 5s. 6d. (includes rail and lunch to be sent by May 31st to G. A. LANSDOWN, 9, Regent-street, S.W.)  
E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

## Trade News.

### WAGES MOVEMENTS.

ABERDEEN.—The operative cabinetmakers have received an advance of a farthing per hour in their wages. Their demand was that those in receipt of 7½d. per hour and under should get a halfpenny of an increase, and those in receipt of 8d. a farthing of an increase.

BOLTON.—A conference took place on Tuesday night between the master stonemasons and operatives' representatives to consider the demand made by the latter for an advance in wages of a penny per hour and certain alterations in the working rules, which would mean increased cost of production to employers. In order to avoid a strike the masters offered a halfpenny per hour increase, making the men's remuneration 9½d. This was refused by the operatives, who insisted on having all that was asked for, and they will consequently strike work next Wednesday. The employers have withdrawn their offer, and are determined to resist the men's demands.

EDINBURGH AND LEITH.—At a mass meeting of joiners, held in the Opreta House, on Monday, it was reported that four additional employers (including Messrs. Mackenzie and Moncur, who employ 220 men) had signed the by-laws granting the workmen's demands. The total number of conceding employers is thus twenty-two, who are employing about 350 workmen. Over 350 workmen have been sent to work at other centres since the strike began. The total number removed from the strike roll is 860, leaving 757. At a mass meeting of plumbers held on the same day in Marshall-street Hall, it was reported that three additional employers had granted the advance of wages, making the total number of conceding employers 33.

GLASGOW.—At a full meeting of master wrights held in the Building Trades' Exchange, Glasgow, on Monday, to discuss the position of the trade in view of the joiners' strike, it was decided after about an hour's discussion that the by-laws should be signed. The men therefore resumed work on Wednesday.

The opening of the new Post-Office at Greenock was performed by Sir Thomas Sutherland, M.P., on Monday. The new Post-office, plans for which were prepared by Mr. W. W. Robertson, her Majesty's Office of Works, Edinburgh, is Renaissance in style, is situated in Cathcart-street, near the Central Station, and has been erected at a cost, including site, of about £20,000.

The will of the late Mr. William Tanner Neve, of Osborne Lodge, Cranbrook, formerly a surveyor, who died on March 8, aged 84, has been proved at £169,334 gross and £157,662 net.

Colonel C. H. Luard attended at Settle, on Friday, relative to an application by the rural district council for permission to borrow £4,870 for the purchase of new buildings for offices and other purposes. There was virtually no opposition to the scheme, which provides for the acquisition of the block of buildings known as the Town Hall, situate in the Market-place, Settle.

The opening of the new park in Plantation district of the burgh of Govan took place on Saturday. The new park, which covers seven acres, and cost (ground included) about £20,000, is situated to the south of Paisley-road West.

## WATER SUPPLY AND SANITARY MATTERS.

SHADWELL.—An inquiry was held on Wednesday, May 17, by Colonel J. T. Marsh, R.E., Local Government Board inspector, with reference to an application for sanction to borrow the sum of £2,000, by the Wetherby District Council, for the purpose of sewerage the parish of Shadwell. Mr. E. H. Coates, clerk to the district council, opened the case for the council, and called the engineer, Mr. E. J. Silcock, C.E., of Leeds, who explained the scheme. The works of sewerage consist of pipe-sewers to collect the sewage of the more thickly-populated portions of the parish and convey it to the disposal works, which are proposed to be situated on about 1½ acre of land. The method of purification proposed is a septic tank and four bacteria filters, and the effluent is to be applied to land. The tank and filter-beds will be constructed of concrete, the tank having a capacity of one day's dry weather flow of sewage, and a working set of three filters being worked at the rate of 186 gallons per square yard per 24 hours. Dr. Hargreaves, the medical officer of health, and the nuisance inspector, also gave evidence as to the sanitary state of the parish. Mr. Ramsden (of Messrs. Carter, Ramsden, and Co., solicitors, Leeds) appeared on behalf of the principal inhabitants to oppose the application, on the ground that if the district council carried out their duties of scavenging, &c., it would not be necessary to have a sewage scheme at all. After hearing the evidence the inspector visited the district and inspected the site of the proposed purification works.

## LIST OF COMPETITIONS OPEN.

Leeds—Market Hall and Shops, Kirkgate Market .....	£150, £100, £50.....	The City Engineer, Municipal Buildings, Leeds .....	June 1
Okehampton—Workhouse and Infirmary (93 inmates) .....	£50, £25 .....	Geo. L. Fulford, Solicitor and Clerk, Union Office, Okehampton ..	1
Salford—Public Hall, Shops, and Model Cottages on Site of Infantry Barracks .....	£31 (merged), £20, £10 .....	The Borough Engineer, Salford .....	6
Wakefield—Central Premises .....	£50, £30, and £20 .....	J. W. Haigh, Sec., Industrial Society, Bank-street, Wakefield .....	30
Buckie—Bridge over Buckie Burn (£1,600 limit) .....	25gs. ....	J. L. Naughton, Clerk to Commissioners, Buckie, N.B. ....	30
Harrogate—New Kursaal, &c., at Spa Concert Room (limit £20,000; Assessor) .....	£150, £100, £75.....	Samuel Stead, Borough Surveyor, Municipal Offices, Harrogate .....	July 3
Lichfield—Grammar School .....	£20 .....	H. H. Brown, Clerk to Grammar School Governors, Lichfield ..	3
Plumstead—Municipal Buildings and Public Library, Glossop- road (cost £40,000; E. W. Mountford, F.R.I.B.A., Assessor) .....	£100, £75, £50 .....	Edward Hughes, Clerk, Vestry Hall, Maxey-road, Plumstead .....	27
Edinburgh—Midlothian County Buildings, Parliament-square .....	£75, £50, £25 .....	A. G. G. Asher, W.S., County Clerk, County Rooms, Edinburgh ..	—
Clacton-on-Sea—Laying-out Cliff Frontage (900ft.) .....	£20 .....	G. T. Lewis, Clerk, Town Hall Buildings, Clacton-on-Sea .....	—
Totnes—Cottage Hospital .....	£30 (merged), £10 .....	The Chairman, Cottage Hospital Committee, Totnes .....	—
Aldershot—Masonic Hall (£2,500 limit) .....	.....	John Yould, Secretary, The Triangle, Aldershot .....	—
Hawick—Houses and Cottages .....	.....	W. Haddon, Solicitor, Sec. Building Co., Hawick .....	—

Maidstone—Road Materials .....	Urban District Council .....	T. F. Bunting, Fair Meadow, Maidstone .....	31
Wolverhampton—Road Materials .....	Tramways Committee .....	J. W. Bradley, Borough Engineer, Town Hall, Wolverhampton .....	31
Christiania—Portland Cement (900 barrels) .....	State Railways Administration .....	Overingeniusens Kontor, Levanger, Norway .....	31
Kingston-upon-Thames—Granite (3,000 tons) .....	Corporation .....	H. A. Winsor, Town Clerk, Clattera House, Kingston-upon-Thames ..	31
Desborough—Granite for Road Metal (300 tons) .....	Urban District Council .....	D. J. Diver, Surveyor, Council Offices, Desborough .....	31
Levenshulme—Limestone Chippings, Artificial Flags, &c. (1 Yr.) ..	Urban District Council .....	James Jepson, District Surveyor, 8A, Thiriot Dale, Stockport .....	June 3
Pershore—Stone for Repair of Highways (One Year) .....	Rural District Council .....	Arthur E. Baker, Clerk, Pershore, Worcestershire .....	6
Branksome—Granite (275 tons) .....	Urban District Council .....	J. Newman, Surveyor, 3, Tennyson Bldgs., Ashley-rd., Branksome ..	6
Wolverhampton—Granite Setts (5,700 tons) .....	Streets Committee .....	J. W. Bradley, Borough Engineer, Town Hall, Wolverhampton .....	30

## CHIPS.

The Acorn Board Schools, York, are being warmed and ventilated by means of Shorland's patent Manchester grates and patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Lady Aberdeen opened at Mountain Ash, on Monday, a new public hall and institute erected by the workmen, at a cost of £9,000, on ground leased from Lord Aberdare at a nominal rent. Mr. D. Lloyd, of Mountain Ash, was the architect, and Messrs. C. Jenkins and Sons, of Porth, were the builders.

Colonel C. H. Luard, an inspector of the Local Government Board, held an inquiry on Friday at the town-hall, Salford, with reference to an application of the corporation for permission to borrow £5,822 for electric-lighting purposes, and £4,000 for the building of a public hall, library, and reading-room at Irlams-o'-th'-Height.

The mayor of Swansea has formally opened the Victoria Nurses' Home erected in connection with the Swansea General Hospital, at a cost of £1,800, in honour of the Queen's Diamond Jubilee.

A new hotel, "The Ocean," has just been opened at Sandown (I.W.) from the designs of Mr. Lewin Sharp. It has been magnificently furnished as a country house, and special attention has been paid to the sanitary and heating arrangements, Messrs. C. P. Kinneir and Co. being responsible for the latter. The dining-hall is furnished in Chippendale style, and is an exact copy of the Queen's private dining-room at Windsor, whilst other suites are furnished in pure Louis XV. style, the furniture in the drawing-room being actually of that period. An important feature is that in addition to the Royal suite there are, on each floor, bedrooms, sitting and bathroom, which can be shut off from the rest of the hotel to form a suite in itself. The builder is Mr. Jas. Hayden, of Sandown.

Mr. W. A. Ducat, Local Government Board Inspector, held an inquiry at the Oldham Town Hall, on Friday, into the application of the Corporation for power to borrow £14,209 for the erection of refuse destructors at Hollinwood and Robin Hill, and £12,335 for the erection of public baths at Hathershaw and Lowermoor.

At the last meeting of the London Sanitary Committee, the scheme of Mr. Edwin T. Hall, F.R.I.B.A., for the extension and completion of the Manston Infectious Hospital was adopted, and he was instructed to prepare detailed plans and specifications. Over 300 additional beds will be provided, besides extra accommodation for the resident staff.

The Board of Trade have confirmed an order, intitled the Merthyr Tydvil Railway Order, 1899, authorising the construction of light railways in the counties of Glamorgan and Brecon, between Vaynor Dowlais and Merthyr Tydvil.

## AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2317.

FRIDAY, JUNE 2, 1899.

### REPLICAS.

REPETITION is frequent in all artistic work, and a great deal that an architect does may be placed under this description. When he designs a row of houses for an estate, he finds it economical to build on the same plan and elevation, though it is now, happily, a custom to vary the latter a little. His scheme for a large hospital or collegiate establishment is largely made up of repetition. It would be easy to write a discourse on the economy and moral influence of repetition in house-building as it affects the individual and the community. There is an ethical as well as an artistic side to the question, which even the speculative builder, sordid as he is, can ill afford to despise. In many of the recently developed building estates round London, the idea is prevalent that variety is not merely charming, but of some pecuniary value; men and women of differing habits and tastes find it easier to select a dwelling that will suit them from among many of varying types: and it has been long a marvel why mechanical repetition in house-building should have so persistently prevailed, to the intent, as it would seem, of showing that every individual is cast in the same mould. A number of houses built on the like plan and of identical size, in which the same fittings and details can be multiplied, is cheaper to build: there is less setting out, less labour, and a saving of material. Machinery has aided in the production of repetition in building, so that, in spite of all that can be urged against it, repetition will always be a factor in modern building which the architect has to reckon with. So much from the commercial point of view.

The necessity of repetition also arises from the requirements of modern buildings designed for a large number of people. Take as an example a large school or college, or a hospital: it is made up mainly of units—of students' rooms and dormitories, or of pavilions of wards for the sick. There is no object gained in varying these parts, at least from an economical view. The architect can, indeed, in his grouping and design give variety; he can make this room wider or longer; he can throw out a large bay in certain wards or day-rooms, and so avoid monotony. This entails extra thought and labour on his part, not appreciated as it ought to be; but it is an artistic protest against repetition. Dislike it as we may, the repeating or duplication of features cannot be avoided. Every class of building repeats itself as soon as there is nothing further new to introduce. Directly a plan is perfected, there is little more to do than to repeat it; so it is that our churches, more than all other buildings, show so little variety in their main parts. The old 16th-century type of church found many copyists, the same type with slight variations appearing in every county. Has it not been the same with house-building? We can point to a few recognised forms of plan in the terrace or street-dwelling, and some well-worn types of gabled houses, the Manor-house and Tudor Hall plans which have all been imitated. This quiescent condition of design reached, there is little to add: the architect can vary his models within certain limits; but, on the whole, he has to be content to repeat general forms and features. Repetition implies too often poverty of thought, as we find in the imitations we meet of the old 18th-century brick style, with its plain sash windows and

large stacks of chimneys; still more in the imitations of Gothic churches in the earlier part of this century, where naves and lean-to aisles were copied with the most nauseating likeness, and a future generation will regard with similar feelings our replicas of "Queen Anne" and Neo-Renaissance which are being repeated in every suburb and in every street.

No doubt the necessity of repeating buildings, or their plans and external features, have, to a large extent, abetted the copyist. He has a fair excuse to make to Mr. A., who charges him with a flagrant copyism of his design. He can say that his building was only a copy of some other building; that, in point of fact, there was little to choose, the plan only embodying the usual arrangements, leaving little to vary in the elevations. In short, he can argue that between legitimate adaptation and imitation there is very little margin: that no one can charge another with plagiarism if he cannot prove his sole right to use a certain plan or arrangement of features. And no doubt it would be difficult to establish a claim for absolute originality.

In addition to repetition in the larger sense of the term, the replication of parts is common. Many large buildings like hospitals duplicate themselves on each side of a centre axis, and to this extent the work of the architect is reduced. One side is a repeat of the other in its chief parts and features. Such replication is a source of unity and power in all great buildings, and the architect who studiously neglects it would signally fail in producing an impression. Every portico, every west front of a cathedral, is an instance of symmetrical replication of parts, but there are limits to its use. There are some plans that cannot be duplicated: they do not admit of an axial distribution of parts, many municipal office blocks, baths and washhouses, technical schools, hotels, and private residences are often better arranged unsymmetrically; and the attempt to place the entrance in the centre and to arrange two wings would be affectation. The artistic and ingenious planner is never at a loss when to adopt the first or second of these arrangements. He regards his requirements, the number and sizes of his rooms, their relative importance to each other, and determines which principle to adopt; he can make his chief masses cohere and group together quite as well with a tower or assembly-room on one side, with the other lesser parts leading up to it. Nor does his composition lose by this un-bilateral arrangement: he emphasises his most important hall or entrance, and disposes his buildings in such a manner as to express the relation of parts to the whole. Of recent examples of the bi-lateral or axial design we may mention Mr. Aston Webb's able design for the Cromwell-road front of the Victoria and Albert Museum, a building in which the conditions of plan called for an axial arrangement, and where a number of large courts could be duplicated, and also his design for the Britannia Royal Naval College, Dartmouth; or Mr. J. M. Brydon's New Government Offices design. In these buildings the rooms or offices of similar size and of equal importance could be planned in halves on each side of a main entrance.

There is another aspect of repetition or replication that may be briefly touched upon—its relation to remuneration of architects. It is considered reasonable that in charges for designs repetitions of plan or design should be on a lower scale than for buildings where such do not occur; and this question of remuneration is a frequent one made by architects who have prepared designs in which similar blocks are repeated, like labourers' cottages, houses on building estates, and the like. Or an architect has prepared quantities for several blocks of houses of the same design, and he naturally inquires as to what he should

charge. In this connection we may refer to the revised Schedule of Charges adopted by the Institute some time ago, and referred to in our pages. Clause 4 of this schedule states: "When several distinct buildings, being repetitions of one design, are erected at the same time from a single specification, and one set of drawings and under one contract, the usual commission is charged on the cost of one such building, and a modified arrangement made in respect of the others; but this arrangement does not apply to the reduplication of parts of one building undertaking, in which case the full commission is charged on the total cost." "Several distinct buildings, repetitions of one design," will apply to a number of isolated pavilions for a hospital, dwelling-houses and labourers' cottages in distinct blocks erected from a single set of plans and under one contract; but if there are different contracts for each block, the arrangement will not hold. The question is a difficult one. In many schemes there are a number of distinct buildings of the same design, but connected by corridors with the central block, that may be regarded more as reduplication of parts. In this case the rule will hardly apply. Then as to the modified charge to be made for the other buildings. The only satisfactory course seems to be for the architect to agree with his clients as to the terms at the onset.

### ESTIMATES.—VIII.

MASON.

IN the practice of measuring and estimating masons' work there are many differences, and these have to be considered. In large works where the Mason's bill is important, the practice is to price the work in detail or at the foot cube, separating all labours on it. The items give the stone and labour separately; but in many bills the custom is to price the work at per foot cube, including all labours. The latter plan saves trouble and calculation, and for ordinary stonework is generally trustworthy. The experienced builder or estimator can, no doubt, readily apportion the amount of labour on any particular class of work and the value to be put on it. If sketches are given of the section or mouldings, as in stone sills, mullions, plinths, &c., the items may be fairly priced in this way. Many contractors do not trouble to price the labour items, but take the items of cube stone at a price which they think will pay for labour. This rough method is not a reliable method of estimating, especially if the builder does not examine the drawings and details.

Mr. Leaning, whose valuable "Notes" are worth the study of all estimators, observes as to the modes of taking stonework: "Probably the most exact method, and the one which can most safely be priced, is the measurement of the stone and all the labour on it, presenting them separately in the bill. The experienced estimator will frequently price the cube stone at a rate to include all labours; but he will look through the list of labours before he does so, generally to see what proportion of moulded work they include." By proceeding to price the labours first, the prices will be often found, as this writer says, too high for contract work. The "stone and all labour" is frequently used, the different kinds of labour being separated as far as possible; but this plan is apt to lead to confusion.

Of course, the student in estimating should know the meaning of terms used by the surveyor, such as "half-sawing" or "beds and joints," "plain face," "sunk beds," "sunk face," "circular," and "circular-circular" work, &c. Half-sawing is usually taken to the back and faces for sunk or moulded stonework or to faces to which no other labour is taken.

"Half-sawing" means the surface divided by the saw on each of the pieces of stone.

The rough block from quarry is thus sawn into rough cubes. Formerly half-sawing was taken to all the six faces of the original cube, the plain work being measured over these sawn surfaces in addition where necessary. Surveyors now usually call these surfaces "half-bed" or "half-joint." Beds and joints are measured per foot super., and described as "one surface measured for two," equivalent to labour on the four sides of stone. Thus a bed and joint is taken to each stone, equal to half-bed or joint on four out of the six surfaces of the cube, or top and bottom and two sides.

In estimating stonework by the foot-run, stone and labour included, the scantlings must be taken into consideration where the labour is the same. The pricing must be obtained by comparing the sectional area. A stone sill, 10in. by 6in. = 60in. area, would be equal in price to another 12in. by 5in. In estimating labour on stone, the relative sectional area must be made the basis of the calculation. The proportion of beds and joints to each cubic foot of stone varies. In Classic or Renaissance work  $1\frac{1}{2}$  superficial foot to each cubic foot is considered reasonable, and for Gothic work 2ft. to each cubic foot.

The relative labour or cost would be simplified if a decimal for each kind of stone was given, as Laxton has done for a few stones, taking Portland stone as a basis. Thus, if the sawing and setting to beds and joints per foot super. is for Portland 1.0, that of Bath would be about 0.6; Hoptonwood 1.4 for plain work. The labour on Bath stone is 40 per cent. less than that on Portland; Yorkshire stone 25 per cent. more.

In pricing stone, the cost of the blocks as regards size, thickness of bed, the distance of quarry from building, cost of carriage, unloading, and labour have to be taken into account. Where the quantity of stone required is considerable, the contractor will find it more economical to get an estimate from the quarryman, or the stone can be worked at the quarry, as for a spire or turret. Quarry-worked stone is largely used, and is sent direct from the quarries ready for fixing. The labour on Bath stone is about half that on Portland.

The following are given in Laxton for Bath stone:—Random blocks, per foot cube:—Corngrit, Corsham, &c., Paddington High Level, 1s. 6d.; at Nine Elms, 1s. 6d. Selected blocks, 1d. per cube foot extra. Blocks cut to given sizes, rough from the saw, 4d. to 5d. per foot cube additional.

The quarry prices for labour on Corsham Down stone, supplied by the Bath Stone Firms, Ltd., are:—

	£	s.	d.
Sawn face .....	0	0	1½
Beds and joints .....	0	0	2
Sunk work .....	0	0	3½
Ditto rebated .....	0	0	3½
Ditto circular .....	0	0	5½
Ditto sunk .....	0	0	8½
Plain face .....	0	0	2½
Ditto circular .....	0	0	3½
Sunk face average 2in. deep .....	0	0	5½
Ditto stopped one end .....	0	0	6½
Moulded work (ordinary) .....	0	0	9
Ditto stopped one end .....	0	1	1½
Ditto stopped both ends .....	0	1	3
Ditto circular .....	0	1	0

The cost of Box Ground is about 10 per cent. more than the above.

The prices given in Laxton are in the railway waggons at the loading stations, so that railway carriage, unloading, &c., have to be added.

For small quantities of stone, the builder often underlets the work to a local mason or stone merchant. For larger quantities the builder may enter into agreement with a quarry owner as to price. It is best, where a particular quarry is selected or specified, to obtain from the quarryman a price per foot cube before the contract is signed.

We may first take Portland stone as the stone generally used in the best London buildings. Laxton prices stone in scantling at an average of 3s. 6d. per foot cube in lengths over 4ft.; some contractors put

this stone per foot cube, including hoisting and setting, at 3s. 3d., but the price depends on the quantity.

The following constants are useful approximations to the value of labour:—

	Days of a Mason.
Half sawing .....	028
Beds and joints .....	056
Sunk joint .....	063
Circular joint .....	063
Plain face tooled .....	075
Ditto rubbed .....	090
Moulded work rubbed .....	150
Ditto stopped .....	183
Ditto circular .....	200

	Days of Mason and Labourer.
Hoisting and setting up to 40ft. above ground .....	040

	Days of Labourer.
Extra hoisting, 40ft. to 80ft. ....	025

For waste, allow about 5 per cent.

A London mason is paid 10½d. per hour fixing, and labourers 6½d.

Stone-working machinery is largely employed, especially at the quarries, and by several London firms, and the saving of labour thereby is considerable, often 33 per cent. It is stated on reliable authority that in sawing stones, Bath or Portland,

the cost of machine-sawing may be set down at about 2d. per foot, while the cost of hand-sawing will average 3½d. per foot; the cost of rubbing and facing stone may be put at 1d. to 3d. per super. foot. Stone can be sawn, squared, dressed, and polished; mouldings, like cornices, architraves, pilasters, &c., shaped and finished, and worked at a great saving by machinery.

#### OTHER BRICKWORK ITEMS.

##### No. 12. Ends of timbers cut and pinned.

Beams are generally built in as the work goes up. The ends are made good by filling the space round beam with brick or tile in cement. But if the holes are cut afterwards, as in old work, then the labour is much more. A bricklayer would take about half an hour cutting and another twenty minutes or so in pinning—say, 9d. If the work is only filling-in or "pinning," 5d. would be sufficient.

##### No. 10. Sills made good to and pointed, cutting and pinning ends.

The labour here is in filling-in the course of brick left out under the sill to enable the mason to insert it, and in making good to or

pinning the ends of sill under reveals. We may price this item as follows: Two ends cut and pinned at, say, 6d. each; making good to course under sill, say, 10d. Or—

	£	s.	d.
Bricklayer and labourer, 1 hour .....	0	1	3
(Making good, cutting, and pinning ends.)			
Materials, including, say, eight bricks and cement-mortar .....	0	0	6
Profit .....	0	1	9
	0	0	2
	0	1	11

#### STONEWORK.

In estimating the labour on long lengths of stone, like plinths, strings, cornices, &c., it is generally convenient to take a 3ft. length, that usually being the distance of joints apart, or so many stones, to obtain the value per foot cube or run. By thus taking out the quantities of these items, and then finding the average per foot cube or run, a fair idea of the value of the "stone and labour" can be obtained, as in items such as these:—

Stone and labour in chamfered or moulded plinths.	
Ditto ditto chamfered jambs.	
Ditto ditto moulded strings and cornices.	

There are many short cuts used by surveyors in estimating which can only be discovered after some experience.

52ft. run. 6in. by 6in. Portland stone curb, rubbed on top and both sides, including joints and beds and jointing in mortar.

To value this item the best plan is to take out quantities of stone and labour. Suppose we take the joints at 3ft. apart, the cube of stone, 3ft. by 6in. by 6in., would work out at 9in., and the labour as follows:—

	£	s.	d.
9in. cube stone, including waste, hoisting and setting, &c. (constant '045), at say, 3s. 3d., say .....	0	2	5
Half-bed (3ft. by 6in. = 1ft. 6in.) at 2½d. ....	0	0	4
Plain face, including half-sawing of sides and top, 4ft. 6in. ('090 constant) at 9d. ....	0	3	4
Joints 6in. by 6in. = 3in. at 5d. ....	0	0	1½
3ft. length .....	3	0	6 2½
Cost of 1ft. ....	0	2	0½

This would equal about, say, 8s. 6d. per foot cube, including profit.

25ft. run. Ditto, ditto, with upper edges chamfered, 2in. wide.

There would be 3ft. of chamfer for length of stone each side = 6ft. of 2in. wide. Put this at 1½d. a foot, or 9d. extra, on above.

24ft. run. Portland stone sills, 10in. by 4in., weathered, throated, and grooved for iron tongue. (See sketch.)

Portland stone delivered is about 2s. 6d. per foot cube.

	£	s.	d.
3in. cube at above price .....	0	0	7½
Waste 10 per cent. ....	0	0	0½
Hoisting and setting .....	0	0	3½
2ft. half-sawing to three faces at 3½d. ....	0	0	7
7in. sunk face rubbed at 1s. 6d. ....	0	0	10
Three sides rubbed .....	0	0	4
2ft. groove for tongue and throating ...	0	0	2
10 per cent. ....	0	2	10½
	0	0	3
	0	3	1½

Say 3s. 2d. per foot run, or 10s. per foot cube.

18ft. run. 12in. by 12in. Portland stone stop-splayed sill (8in. and 4in. wide splays), rebated for lights, grooved and bedded in mortar. (See sketch.)

Let us take a 3ft. length.

	£	s.	d.
3ft. cube stone, including waste, hoisting and setting, &c., at 3s. ....	0	9	0
½ bed and joint (3ft. by 1ft. 8in. = 5ft. at 2½d.) .....	0	1	0½
Joint (1ft. by 1ft. = 1 at 5d.) .....	0	0	5
Plain face (3ft. by 1ft. 8in. = 3ft. 9in. at 9d.) .....	0	2	9½
Sunk work stopped, 3ft. long = 3ft. super. at 1s. ....	0	3	0
Groove and rebate 3ft. long, each 1d. ....	0	0	6
Cement, &c. ....	0	0	3
Cost of 3ft. ....	0	17	0½
Cost of 1ft. ....	0	5	8

Or 5s. 8d. per cube foot.

## THE SETTLEMENT OF THE BUILDING TRADE DISPUTE.

As we announced a fortnight ago, the threatened lock-out in the Building Trades has been averted. The credit for this happy ending of a crisis, which had become a very dangerous one, is due to Mr. E. T. Cook, the editor of the *Daily News*, and to his colleague, Mr. Clement Edwards, the Special Commissioner of that journal. It will be within the knowledge of many that this is not the first service of the sort rendered by Mr. Cook and Mr. Edwards. It is an open secret that to their good offices the settlement of the Engineers' dispute was mainly due. Too much credit, in our opinion, can hardly be rendered to the statesmanlike foresight and diplomatic ability which have thus healed two great labour disputes. A lock-out of the Building Trades just now would have been a deplorable event. That it has been avoided is a matter for the heartiest congratulation. It is only fair to add that, but for the generous and conciliatory attitude of the National Association of Master Builders, and the common sense of the plasterers, a good understanding might still have been impossible. Among those who have facilitated it, Mr. Wm. Holdsworth, the president of the National Association of Master Builders, Mr. Benjamin I. Greenwood, Mr. C. W. Green, Mr. George Nichols, Mr. James Higson, Mr. J. W. Sugden, and the ever-courteous and able secretary, Mr. H. G. Hassal, deserve special mention; and no less so on the other side, Mr. Mark Jones, the President of the National Association of Operative Plasterers. Messrs. D. Hennessey, A. McLeod, George Jackson, Henry Duckett, and the general secretary Mr. M. Deller.

In February last some of the London members of the National Association of Operative Plasterers struck against the employment of certain non-unionist foremen. Soon afterwards, a vote of the association in London condemned this action. In the mean time, however, the National Association of Master Builders had issued a list of grievances, and declared a lock-out against the plasterers. The dispute dragged along, week after week, until the meeting of the National Association of Master Builders at Birmingham three weeks ago.

This meeting decided to call upon all the unions in the building trades to repudiate sympathy with the plasterers, or as an alternative to have the whole of their members locked out. The gravity of this decision was pointed out by us at once. It would have been a national catastrophe of the gravest character. The editor of the *Daily News* felt that if anything could be done to avert so disastrous a state of things, it ought to be done in the highest national interests. To this end a careful examination was made of the points at issue between the Plasterers' Association and the Master Builders. This led to the belief that a little friendly and informal negotiation between leading men on both sides might pave the way towards a conference and a pacific settlement. Friendly and informal communications were, therefore, opened up with Mr. Greenwood, on behalf of the employers, and Mr. Dan Hennessey and Mr. Geo. Cole, on behalf of the plasterers. Although there was a good deal of going backwards and forwards required to get even comparative agreement upon some of the more difficult points at issue, matters progressed so satisfactorily, that at last it was felt that more formal overtures could be successfully made to the official heads of both sides.

Thereupon Mr. Deller and his executive council were seen, and a suggested basis of settlement was formally submitted by the editor to Mr. J. A. S. Hassal, secretary of the National Association of Master Builders, on the one side, and Mr. M. Deller, secretary of the National Association of Operative Plasterers, on the other side. Both sides were further asked if they agreed to this suggested basis, to meet in conference upon neutral ground, to see if a settlement could not be arrived at. It was suggested that the conference should consist of six representatives from each side. Both sides met—the employers in Birmingham, and the plasterers in London—and agreed both to the suggested basis of settlement and to the conference.

The conference assembled at eleven o'clock on Tuesday at the Salisbury Hotel, and sat till past seven. At half-past one there was an adjournment for luncheon, at which Sir John R. Robinson, the manager of the *Daily News*, took the chair.

The following gentlemen represented the National Association of Master Builders:

Alderman Holdsworth, President; Mr. B. I. Greenwood, London; Mr. C. W. Green, Liverpool; Mr. Geo. Nichols, Leicester; Mr. James Higson, Manchester; and Mr. J. W. Sugden, President of the National Master Plasterers' Association, Bradford. The representatives of the Operative Plasterers were: Mr. Mark Jones, President; Mr. M. Deller, secretary; Mr. Dan Hennessey, London; Mr. A. McLeod, Newcastle-on-Tyne; Mr. Geo. Jackson, Manchester; and Mr. Henry Duckett, Birmingham. There were also present Mr. J. A. S. Hassal, secretary of the National Association of Master Builders, the Editor of the *Daily News*, and Mr. Clement Edwards.

The proceedings opened at eleven o'clock, when the Editor of the *Daily News* made a brief statement of the steps which had been taken to bring about the conference. Thereupon Alderman Holdsworth proposed, and Mr. Mark Jones seconded, a proposal that the Editor of the *Daily News* be asked to take the chair. This was unanimously carried, and the request being acceded to, the conference at once settled down to formal business. It was agreed that the meeting should first devote itself to drawing up the general terms of the settlement, and afterwards proceed to embody them in a code of rules. The conference then proceeded to discuss the suggested basis of settlement submitted by the Editor of the *Daily News* to both sides a few days ago.

## TERMS OF SETTLEMENT.

After considerable discussion, the following terms of settlement were arrived at and signed:

## NON-UNION FOREMEN.

With regard to Clause 1 (a) and (b) of the employers' "Manifesto," which alleges:

The persistent attempt to coerce foremen of plasterers, or superintendents of plasterers' work into the membership of the National Association of Operative Plasterers; also:

The withdrawal of all members from the building firms employing such foremen or superintendents.

It is understood that the vote of the Plasterers' Association in London, in February, against this practice settles this point.

## APPRENTICES.

With regard to Clause (2) which deals with the limitation of apprentices, it is agreed that, as this question is peculiarly complicated, different practices prevailing in different districts, both as to the extent to which apprentices are employed, and as to the ages at which they begin their apprenticeship, the question shall be referred to a Special Joint Committee of both sides to draw up working rules to govern the matter. This Conference is of opinion that the difficulty with regard to the proportion of apprentices could best be solved by a provision that every apprentice should be legally bound.

## BOYCOTTING AND BLACKLISTING.

With regard to Clause 3 (a) and (b), which charges the Plasterers' Association with:

(a) The practice of boycotting certain building firms and employers of plasterers, in spite of the fact that such firms adhere to the rules agreed between the Master Builders' Association and the National Association of Plasterers.

(b) And the practice of printing and circulating amongst the members of the National Association of Operative Plasterers a list of such firms for whom they are forbidden, under penalty, to work.

It is understood that, while not admitting the accuracy of these allegations, the Plasterers' Association give an undertaking that no such boycotting or blacklisting shall take place in future where the firms adhere to the rules mutually agreed upon, the employers, on the other hand, giving a definite undertaking that such rules mutually agreed upon shall be strictly enforced in all parts of their contracts.

## DEMARCATON OF WORK.

With reference to Clause 5 (a) and (b), which alleges:

(a) The refusal to accept the decision of the employer as to which workmen shall do certain work, in cases where plasterers dispute with other trades as to their right to do such work.

(b) Practice of withdrawing all their members when such work may not be placed in the plasterers' hands.

It is agreed that, for the purpose of the demarcation of work, joint committees shall be established in the different districts equally representative of the employers and the mechanics, whose representation shall be equally divided amongst the different branches of the trade in question. These committees shall, as far and as soon as is possible, draw up schedules of the work which it is recognised belong to certain branches of the trade. To such committees shall be immediately referred all points of dispute as to demarcation, and the decision of the majority in each case shall be accepted as binding on both sides. Should they fail, however, to decide, then the matter shall be referred for settlement to similarly constituted joint committee representative of the National Association of Master Builders and the other societies affected, whose decision shall be final, provided that the employers' representatives are bona-fide employers of plasterers direct. Pending such reference to the local committees no strike or lock-out shall take

place, but the decision of the employer shall be provisionally accepted as to who shall do the work.

Provided that preference shall be given to that branch of the trade which, in practice, has done the work before in that district, and provided no preference be given on account of the payment of lower wages.

## NON-UNIONISTS AND DISPUTES.

With regard to Clauses 4 and 6, which speak of The refusal to work on buildings where some of the workmen employed may not belong to a trade-union, And of the objection to submit all trade disputes to discussion at a conference between employers and employed with a view to arrive at an amicable settlement prior to any strike or withdrawal of workmen.

It is agreed that, in the event of a dispute arising on any job or works, the district officials of the National Association of Operative Plasterers shall send written notice to the local Association of Master Builders, who shall inform them whether the said builder is a member of that body. If so, a strike shall not be sanctioned by the N.A.O.P. until six clear working days have expired from the receipt of such notice, during which time the matter shall be considered by the employers and the representatives of the workmen with a view to an amicable settlement. It is understood that the men the Operative Plasterers object to work with are defaulters, and other men who have been shown to the employers to have made themselves specially objectionable to the Union men.

## FOREIGN "FREE LABOUR."

It is agreed that where the employers are able to secure British plasterers to meet their requirements they will dispense with the services of the Continental plasterers engaged during the present dispute as their contracts may expire. The employers will not require members of the N.A.O.P. to work on the same buildings with such plasterers. The members of the N.A.O.P. shall raise no difficulties in fixing work prepared by the Continental plasterers.

Signed,

WM. HOLDSWORTH, President.

BENJAMIN I. GREENWOOD.

C. W. GREEN.

GEORGE NICHOLS.

JAMES HIGSON.

J. W. SUGDEN.

H. G. HASSAL, Secretary.

(On behalf of the National Association of Master Builders of Great Britain and Ireland.)

MARK JONES, President.

D. HENNESSEY.

A. MCLEOD.

GEORGE JACKSON.

HENRY DUCKETT.

M. DELDER, General Secretary N.A.O.P.

(On behalf of the National Association of Operative Plasterers.)

(In witness)

E. T. COOK (Editor of the *Daily News*), Chairman of the Conference.

CLEMENT EDWARDS, of the *Daily News*.

## GENERAL RULES.

The general terms of settlement having been agreed to, the representatives of each side retired to consider a suggested code of rules, submitted as embodying the general terms. This, however, the plasterers' delegates declared they were unable to accept, and the Chairman of the Conference was asked to draw up a code. This he did, and it was agreed to and signed as follows:—

1. The Plasterers' Association will not take any steps to compel managing foremen of plasterers, or superintendents of plasterers' work, into the membership of the N.A.O.P.

2. (Apprentices—rules left for special joint committee to settle, in accordance with the general agreement arrived at by the Conference.)

3. No boycotting or blacklisting shall take place by the N.A.O.P. in future where the firms adhere to the rules mutually agreed upon. The employers agree that such rules shall be strictly enforced in all parts of their contracts.

4. For the purpose of the demarcation of work, joint committees shall be established in the different districts, equally representative of the employers and the mechanics, whose representation shall be equally divided amongst the different branches of the trade in question. These committees shall, as far and as soon as is possible, draw up schedules of the work which it is recognised belong to certain branches of the trade. To such Committees shall be immediately referred all points of dispute as to demarcation, and the decision of the majority in each case shall be accepted as binding on both sides. Should they fail, however, to decide, then the matter shall be referred for settlement to a similarly constituted Joint Committee, representative of the National Association of Master Builders and the other Societies affected, whose decision shall be final, provided that the Employers' representatives are bona-fide Employers of Plasterers direct. Pending such reference to the Local Committees, no strike or lock-out shall take place, but the decision of the Employer shall be provisionally accepted as to who shall do the work, provided that preference shall be given to that branch of the trade which, in practice, has done the work before in that District, and provided that no preference be given on account of the payment of lower wages.

5. In the event of a dispute arising on any job or works the District Officials of the N.A.O.P. shall send written notice to the Local Association of Master Builders, who shall inform them whether the said Builder is a member of that body. If so, a strike shall not be sanctioned by the N.A.O.P. until six clear working days have expired from the receipt of such notice, during which time the matter shall be considered by the employers and the representatives of the workmen with a view to an amicable settlement. Failing a local settlement, reference shall immediately be made to a Central Joint Committee of the two Associations, and until five days have expired from the date of this reference, no strike or lock-out

shall be sanctioned either by the N.A.O.P. or by the National Association of Master Builders. With regard to the alleged refusal of Members of the N.A.O.P. to work with workmen who may not belong to a trade union, it is understood that the men the Operative Plasterers object to work with are defaulters and other men who have been shown to the Employers to have made themselves specially objectionable to the Union men.

6. These Rules shall be construed together, and in the light of each other.

WM. HOLDSWORTH, President.

BENJAMIN I. GREENWOOD.

C. W. GREEN.

GEORGE NICHOLS.

JAMES HIGSON.

J. W. SUGDEN.

ADOLF G. HASSAL, Secretary (on behalf of the National Association of Master Builders of Great Britain and Ireland).

MARK JONES, President.

D. HENNESSEY.

HENRY DUCKETT.

A. McLEOD.

GEORGE JACKSON.

M. DELLER, General Secretary (on behalf of the National Association of Operative Plasterers).

(In witness,

E. T. COOK (Editor of the *Daily News*), Chairman of the Conference.

CLEMENT EDWARDS (of the *Daily News*).

It will be noticed that Clause 2 as to apprentices was left over to a committee to settle. This committee, consisting of three a side, sat in a separate room for an hour, but were unable to arrive at a definite settlement. The full conference thereupon resumed its sitting, and, after some discussion, the chairman urged the following as a possible solution:

No employer shall engage any additional apprentices to the Plastering Trade whilst the number of his apprentices shall exceed one-fourth of the number of journeyman plasterers then employed by him. All apprentices shall be legally bound.

The proposal was unanimously agreed to.

It was understood that the National Association of Operative Plasterers will have to submit the terms of settlement to their members for approval before work can be resumed. This vote will be taken next week, so that in all probability the men will be back at work early in the following week.

THANKS TO THE "DAILY NEWS."

At the conclusion of the proceedings, Mr. B. I. Greenwood said: I should like at this stage, on behalf of the National Association of Master Builders—and, for once, I think you will allow me to express the views of the operative plasterers—to say that we are greatly indebted to the Editor of the *Daily News* and his colleague, Mr. Clement Edwards, for the part that he has played in this matter. I was present at the last conference, and when we separated I was certainly under the impression that it would be a long time before we met again. Probably it would have been had it not been for his timely intervention. He has been at some trouble, I know, in order to bring this meeting about, and I think the way in which he has succeeded, in an almost impossible task, entitles him to the greatest possible credit, and also entitles him to our warmest thanks. I do not know why it was that I was approached in the original instance, unless it was that I am known to be a man of a very peaceable nature, and the one most likely to bring about peace. (Laughter.) I notice that remark is received with a little laughter; but here, again, I have great difficulty in convincing you, gentlemen, that I speak with honest conviction; but I assure you in this case I have not the slightest doubt in my own mind that the reason I was approached, on behalf of the Masters' Association, was because of the knowledge that I was inclined to peace. However, that is a personal matter which I do not wish to press at this juncture, and I do not rise to speak about myself, or what I have done, but I rise in order to express, in the name of the whole Conference, our great indebtedness to the Editor of the *Daily News*, not only for what he has done in bringing us together to-day, but also for the able and conciliatory way in which he has presided over our deliberations. I think the result we have arrived at is in no little degree due to his efforts and assistance. I beg, therefore, to move a very hearty vote of thanks to our chairman.

Mr. M. Deller: I beg to second the motion, for I, like Mr. Greenwood, am quite confident that had it not been for his good offices, and those of Mr. Edwards, that we should never have approached you. Like Mr. Greenwood, too, I am a man of a peaceful nature, but, at the same time, I must confess that although I am not a fighting man, when once I take my coat off I certainly go the whole hog. I can only say that we quite appreciate his good offices, and I quite endorse the views of Mr. Greenwood, when he says that he believes it is through the able manner in which the Editor of the *Daily News* has conducted this meeting, that we have been able to arrive at so

amicable and early a settlement. I feel myself that we should never have been able to have drafted these rules, as they have been drafted, had it not been for his skilful services.

Mr. Alderman Holdsworth: As President of the National Association of Master Builders, allow me to endorse the views that have been stated by both Mr. Greenwood and Mr. Deller on this proposed vote of thanks to you, Mr. Chairman. Allow me also to express my personal thankfulness and gratitude towards your colleague, Mr. Edwards. I assure you that to-night I shall sleep much more soundly than I have done for a considerable length of time. During this war I have received so many communications from different parts of the country, and more advice than any lawyer could give. Very different opinions are held by our members, and it has been a source of great worry and anxiety to me. I feel that the Editor of the *Daily News* and his colleague have got me out of my difficulties, which have lasted so long. But both sides can go away from this meeting with satisfaction, knowing that we have not been trying to get the advantage of each other. The past has been a misfortune, and in future, I hope, there will be a better understanding, and that our conference to-day will cement us for the future, and result in pleasanter association and more agreeable work betwixt the employer and employed. Allow me personally to express my thanks to you for your intercession and mediatorial work.

The motion was unanimously agreed to, with acclamation.

The Chairman: Gentlemen, I am exceedingly obliged by the compliment which you have paid to me, but your thanks are really due in a far greater measure to my able colleague Mr. Edwards. It is sometimes said that the greatest of British interests is the interest of peace. Well, from the point of view of a newspaper man, I cannot say I have found that. It seems to me that I have found the British public considerably less interested in the subject of peace, whether in conference or elsewhere, than in battles and disputes. I am afraid that by ending this industrial struggle we have spoilt a good deal of excellent copy. On the other hand, we must take as much satisfaction as we can from the fact that we have rendered some small service to the trades more intimately concerned, and through them to the general trade of the country. I can only say I have not been at all surprised by the result of this conference, because all through the negotiations and inquiries Mr. Edwards made, both he and I were struck very much with the eminently conciliatory and reasonable spirit that was manifested by influential men on both sides. I will only venture to add an expression of a hope that this may be found to be a real settlement, as well as a settlement on paper; that it will be accepted *bona fide* by both parties in that spirit; and that neither on the one side nor on the other will any attempt be made to pursue a policy either of retaliation or victimisation; that bygones will be bygones; and that a real effort will be made to work in the future on more satisfactory and pacific lines. I thank you very much again for the compliment you have paid me.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute was held on Monday evening at 9, Conduit-street, W., the President, Professor GEORGE ARCHIBON, R.A., in the chair. At the commencement of the proceedings the meeting was made special for the purpose of temporarily suspending the regulations of By-laws 3 and 7, so as to allow of the nomination as a Fellow of the Royal Gold Medallist elect, Mr. George Frederick Bodley, A.R.A. The motion for suspension of the by-laws was carried by acclamation. The Secretary, Mr. W. J. LOCKE, announced the decease of Mr. Charles Bell, Fellow, of Salter's Hall-court, E.C.

#### THE PLANNING AND CONSTRUCTION OF BOARD SCHOOLS.

A paper on this subject, illustrated by many plans, elevations, and working drawings, was read by Mr. T. J. BAILEY, Fellow, architect to the School Board for London. Dealing first with the public elementary school, the author dwelt upon the need for careful selection of the site. An ideal site would be one of about 2 acres, rectangular, with the longest side as a street frontage, and having a western aspect streetwards. There should be proper provision of light

and air, immunity from noise of traffic for classrooms, an open playground space of at least 30 superficial feet for each child, and of such a shape as to be available for games, such as football for the boys, tennis, &c., for the girls. In London and crowded districts where the ideal 30ft. minimum cannot be realised, the playground question is usually best solved by providing on the ground-level for boys and infants, and putting a flat over the whole top of the building to form a playground for the girls. Where sufficiently large, playgrounds should have a covered space 50ft. or 60ft. by 18ft., with sides inclosed, open in front to the sun. Various desirable accessories to playgrounds, the most suitable paving, walls and railings, gates, the school-keeper's lodge, &c., were duly detailed by the author. Next treating of the buildings, of which 430 have been completed and opened, and others are in course of erection, the author described

#### THE THREE-STORY SCHOOL.

as being the most usual type. The infants are on the ground floor, the girls on the first floor, the boys above. The maximum size or accommodation of a group should not exceed 1,548—in departments of boys 516, girls 516, infants 516; and if further accommodation is required, it should be provided by a separate mixed department. The hall, considered by the board indispensable to every department, is a very good size at 54ft. by 30ft.; the classrooms, ten in number to each department, graduate from 60 to 40 in accommodation. If possible, the main line of classrooms should face the playgrounds rather than a noisy road, and draw their light from the east, as that aspect suns up the rooms in the early morning, and does not disturb them for the day. The hall, facing west, provides a good reservoir of sun-lighted air to help the classrooms, and is a cheerful place to march the classes into for recreative or collective purposes. Architecturally, this elevation, being the more broken up (comprising the main lighting of the hall, the staircases, cloak, and teachers' room, and blocks and gable ends of wings), is more desirable for a street front than the long, unbroken line of classrooms. Two staircases for each senior department are required, and two entrances for the infants on the ground floor. The author then described in detail the plan of the building, the dimensions of the various rooms and staircases, the fittest materials for facing walls, and for floors and staircases, the requisite fittings, and the lavatory and sanitary arrangements. Touching

#### WARMING AND VENTILATION.

the author glanced at the efforts towards improvement in these matters during the last twenty years. He commended as very good the system of low-pressure hot-water pipes round the walls and just above the floor, where the desks are placed, and a few ventilating radiators bringing in warm, fresh air; but, even with this system, an open fire in the room is needed, the back flue simply connecting with the outer air not being sufficient for extraction. The author had tried trunks from the ceiling-line of each room gathered into groups, with a single outlet equal to the combined area of the group, and with a coil of hot pipes in the same to produce an up-cast. This was effectual so far as ventilation was concerned, but could not be recommended for schools of more than one story in height; in three-story buildings it had the effect of conveying the sound from the rooms below to those above, and disturbing the classes. The greatest care should be taken to get continued purity of air, and with as little trouble as possible. The system known as the "Plenum" effected this in the only satisfactory way; it introduced fresh filtered air above the heads of the occupants of the room, warm in winter, and cool in summer, diffused it over the area, and extracted it at the floor-level on the same side as the inlet, carrying away with it all the unpleasant odours of damp and evil-smelling garments. This system had the further advantage that where closed, and even double, windows are necessary to exclude noise, there is always a quiet side from which the supply of air can be drawn, and the closed and double windows improve the working. The cost is not appreciably more than an ordinary hot-water installation; but the builder's work involved in the formation of ducts, flues, &c., is a rather costly item. In a section on

#### FURNITURE AND FITTINGS.

the author dealt with the pattern of desks, and

their arrangement in the various departments, the lighting, the seating accommodation, platforms, cupboards, and the pianos, blackboards, and other adjuncts found essential for educational and recreative purposes.

#### ELEMENTARY SCHOLARS AS ARCHITECTURAL DRAUGHTSMEN.

Incidental reference was made to an order issued by the Board to each of their schools requiring a plan of the departments to be prepared by the scholars under the direction of the teacher, measured and drawn to a scale of 4ft. to the inch, the furniture delineated, and the walls coloured in, and submitted to the architect for approval before being framed and hung up in the school. Some two or three hundred of these plans had been submitted to the author, and he had been much surprised and pleased at the general high quality of the work. Few had been returned for revision, and some would have been no discredit to an architect's drawing office. These plans give proof of the useful character of the drawing instruction given in the schools.

#### THE HIGHER GRADE SCHOOLS,

of which there are forty-four in operation under the London School Board, are equipped with rooms for science teaching in addition to those for art and manual work. They comprise chemical and physical laboratories, with balance room and small dark room for experiments in photography, and a store for chemicals, also a demonstration and lecture room. The buildings, fittings, and general arrangements of the Cassland-road School, Hackney, a typical example of the higher grade school, were shown in a series of detail drawings exhibited on a screen.

#### SPECIAL INSTRUCTION BUILDINGS.

A third division of the paper was devoted to buildings for special instruction, comprising centres for domestic economy (cooking, laundry-work, and housewifery); manual training in wood, manual training in metal-work; swimming. The combination of subjects in the domestic economy curriculum has led to the requirement of a building in each case capable of giving proper facilities for the teaching. A typical building, planned, after consultation with the committee in charge of these subjects and the lady superintendent, consisted of a classroom on the ground-floor, 22ft. by 18ft., seated for forty girls, a kitchen, sitting-room, scullery, and bedroom, with entrance-lobby and staircase leading to the laundry and cooking classrooms on the upper floor, the object being to provide instruction in general housework, as well as cooking and laundry work. Details were given of the requirements of the manual training centres for wood and metal work. With the sanction of the Education Department, the Board have decided to establish three

#### SWIMMING BATHS,

in connection with the schools at Marlborough-street, Southwark; Hugh Myddelton, Finsbury; and Lyham-road, Brixton. Particulars were given of the proposed bath at Lyham-road. The building will be separate from the school, and have a distinct entrance, with superintendent's office, towel storage, &c. The actual swimming-pool will be 50ft. by 20ft., 2ft. 9in. deep at one end and 5ft. 6in. at the other, lined with white glazed bricks, and having dressing-boxes, spray-baths, w.c.'s, &c., and washing and drying room for towels and bathing-dresses. The water will be warmed by the injection of steam round the sides, close to the bottom of the bath, the pipes being in chases and cased for protection.

#### PROVISION FOR THE MENTALLY WEAK, THE DEAF, AND THE BLIND.

The mixing of children mentally weak with those of normal intellect being productive of undesirable effects on both, it has been found necessary to provide accommodation for these, and for the deaf and blind, in specially planned buildings. There are 39 centres in actual work in London, with 1597 children on the rolls (Oct. 31, 1898), and about thirty-five more are either in course of building or immediately contemplated. The unit for classroom is less than that for the ordinary school, more individual attention being required. The classrooms are all on the ground-floor, are 20ft. square, warmed by open fires, and seated for twenty children. A hall corridor about 20ft. wide, well warmed and made as cheerful as possible, is provided for

exercise, drill, &c. A good lavatory and bath are provided, boys and girls are frequently taught in mixed classes, but have separate playgrounds and offices. Schools for the deaf are also provided on the centre system, and are much on the same plan as those for the mentally defective. The classrooms are smaller, 18ft. square, and seated for ten. The seats should be arranged in a circle, and the rooms should have a strong high or top light, so that the lips of the children can be watched and studied, they being taught to read what is said by the lip movement. The Board have 17 centres in operation, with 513 children on the rolls (Oct. 31, 1898), and seven more centres are in course of provision. Particulars were given by the author of a scheme for the establishment by the school board of a home for the boarding and instruction of some 40 deaf and mentally-defective children who had to be taught on the sign system. The schools will be built on the cottage home principle, the number in each home not to exceed ten, and the training will be largely agricultural or horticultural. In most divisions of the London district school accommodation has to be provided for a few blind children. These number about 150, distributed over eight centres, and it is generally sufficient to provide two small classrooms at each centre, with separate entrances, cloakrooms, and lavatories, the classes being mixed. Separate play-yards and closets are, of course, necessary, apart from those of the ordinary school, to which this department is attached. Under the head of

BUILDINGS FOR THE TRAINING OF TEACHERS, the author described a scheme of buildings for this purpose, which might be considered as very complete, and as embodying all that is likely to be required in the future. On the ground floor are provided four classrooms for 42 and 36, two of each, seated with single desks; a central hall 50ft. 6in. by 33ft. 6in., with separate staircases, lavatories, &c., for each sex at each end. On the first floor are four first classrooms, and a properly-equipped gymnasium over the hall; on the upper floor an art-room over the gymnasium, the remainder of the floor being devoted to chemical and physical laboratories, lecture-room, balance, and dark rooms. A basement is provided for the engineering apparatus, and also a kitchen for the preparation of luncheons. The site of the particular buildings dealt with was large enough to give space for lawn tennis on the girls' side and for football on the boys'.

#### THE BUILDINGS FOR INDUSTRIAL AND TRUANT SCHOOLS,

which next came under consideration, must be of an essentially different character from other buildings of the Board, as they are boarding establishments. Descriptions were given of a building recently erected for this purpose in connection with the Shaftesbury training ship stationed off Grays, and also of the Upton House Truant School, the only building as yet erected specially for the purpose. The Board are negotiating for a large site of some fifteen acres in the neighbourhood of London for the purpose of erecting two establishments—an industrial school for about 120 boys, and a truant school for a like number. The two institutions will be entirely separate as far as their occupation and management are concerned, but will probably be under the control of one superintendent and body of managers. Details of the proposed plan and general arrangements of the buildings were given by the author.

#### DIVISIONAL OFFICES.

For the purposes of the administrative work of the Board, London is divided into eleven divisions, necessitating a corresponding number of office buildings. The offices for the East Lambeth Division, now erecting in the Peckham-road, were selected for description as a typical block. On the ground floor is the entrance hall, a large room 57ft. by 22ft. for the visitors to perform their clerical work, a room for the assistant superintendent, and an office for the check clerk, also the lavatories, w.c.'s, &c.; on the first floor a committee-room, used also by the superintendent, and a clerks' office; on the second floor the correspondents' and clerks' offices, and caretaker above.

#### COST.

In a few general remarks with which the paper closed, the subject of cost was dealt with. The Princess May School, Kingsland, was cited as a typical case, and as tenders were received only so

late as March of the present year, it may be considered as up to date. The building is to be of three stories, to accommodate 1,548 children, on a site of about 1½ acre; the cost per head is estimated to be £13 18s. 4d. This includes building the whole of the brickwork in cement, also the provision of glazed bricks to staircases, corridors, and dados of classrooms and halls, but does not include furniture. The cost of inclosing the whole site with walls and railings, tar-paving, drainage, and provision for deep foundations below a normal depth of 6ft. is about £5,000 more. The total cost will be some £750 within the limit allowed by the Education Department. There was a suggestion a few years back that unnecessary expenditure was incurred on architectural adornment, and the committee dealing with this branch of the work ordered two or three schools to be built of plain stock bricks and slate roofs, with no architectural features about them. It was found, however, that the difference of cost between bare utilitarianism and buildings designed in some sort of style and regard for materials and colour was rather less than 5 per cent.

Lord REAY, chairman of the London School Board, wrote expressing his regret at being unable to hear Mr. Bailey's paper, adding: "Mr. Bailey speaks with authority. The building operations of the London School Board are on such a large scale, the problems which have to be solved are so varied, they have been so carefully considered by a number of experts, that Mr. Bailey's admirable review of this branch of the School Board work cannot fail to meet with the full recognition due to the care with which it has been written."

The Hon. E. LYULPH STANLEY, vice-chairman of the London School Board, observed that the planning of board schools could never be a simple matter, for, in addition to the requirements of the Education Department, the architect needed to be conversant with the policy of the employing board, for this would govern the size and number of classrooms and the arrangement of his central hall. Mr. Bailey's ideas of the ideal London board school had been obviously modified by the parsimonious policy of his employers—a remark greeted with laughter and applause. The architects present would consider that the walls above the dado level ought not to be left in rough brickwork, which obviously might harbour dust and germs; but should be finished with rendered plastered surfaces. Then no scholar ought to be more than 20ft. from the nearest side-light; but the Education Department had in the past endeavoured to get classrooms so wide that the scholars' distance was increased to 22ft., and even 24ft., from the side-light. The London School Board had been obliged to press upon the department many improvements, and many things which were now regarded by the Department as axiomatic were originally concessions to the board. The Department had sometimes suggested that classes could be taught in the central hall; but it was an undue strain on the teacher's voice to be expected to teach in a hall, which was practically a passageway 60ft. by 20ft., and of proportionate height. There were still many unsettled points in school planning, such, for instance, whether the classroom floor should be graded from the centre, or whether the general floor should be kept flat and the teacher occupy a raised platform, which he himself regarded as the preferable arrangement. The size to be given a classroom depended on the rapidity with which the air could be changed, and it was unwise to make the classroom any larger than was absolutely necessary. The system of ventilation by impulsion was a fine one, but care needed to be exercised lest the draught became too violent or insufficient, or the noise and vibration from the engine too apparent. Any board proposing to adopt a system of ventilation should carefully study and test its working in existing installations before embarking on a scheme. The London School Board had adopted in turn three or four systems, and each fresh one had been regarded—and, he thought, with reason—as an improvement on the one previously adopted. So far as he could judge, a "plenum" system worked apparently better than one on the exhaust principle. Reverting to classrooms, it was an excellent rule to reduce the size of these as the grade advanced, not only because there were fewer scholars in the higher classes, but because the strain on the teacher became greater in advanced studies. In some school buildings classrooms for 80 scholars

were provided; but, as it was considered unwise to put more than 50 pupils in one class, the additional space was more than wasted—a proof that policy ought to determine planning.

Mr. C. J. DAWSON, head master of Aldenham-street School, St. Pancras, said he had to work in one of the earlier buildings, which possessed almost all the defects that had been alluded to by the lecturer. He urged the importance of adapting a building to the exact requirements of present-day teaching, and in accordance with the possibilities of a teacher's power. The great mistake had been making the classrooms too large, and separated only by sliding partitions. In many schools the system of ventilation and warming was an entire failure, and the atmosphere could only be renewed by opening windows, a practice fraught with considerable danger. It was important, both for educational and disciplinary reasons, that there should be no dark corners in schools, and the acoustic properties of a room ought to be well considered in planning.

Mr. E. W. MOUNTFORD, in proposing a vote of thanks to the lecturer, said they were indebted to Mr. Bailey for having laid bare to his professional brethren the secrets which he had been putting into practice all over London; but this had been the more easy to Mr. Bailey because he had no fear of competition in his work. Indeed, when they heard of the numerous schools in progress, and the various problems in planning and construction to be solved, they must have all felt that the architect to the London School Board must be terribly overworked, and that it would be only fair to Mr. Bailey to give some of the work to other architects. (Laughter.) When the speaker was submitting some plans to the late Mr. Ewan Christian as architect to the Charity Commissioners, Mr. Christian flatly refused to sanction any mechanical system of ventilation, declaring that there was nothing equal to the open window. The "plenum" system of ventilation seemed to the speaker to be the best, but he should like to hear the result of practical experience ten years hence. When some members of the Institute Council visited the new hospital at Birmingham a short time since, they found the ventilating ducts full of very black dust, and it seemed as if some of this dust must be forced into the lungs of the patients. It was a great mistake to think that the plenum system could be used for cold air; people would tolerate a draught of warm air, but if cold air were forced in the inlets would be shut down.

Mr. R. PHENE SPIER, F.S.A., seconded the vote of thanks, remarking that he had designed two of the earliest London board schools, but in the light of present-day experience he could see that they were entirely wrong in planning. Mr. Bailey had marshalled his facts in an admirable way, giving them the experiences of a lifetime in a clear and lucid manner.

The vote of thanks having been carried unanimously, Mr. BAILEY briefly acknowledged it, observing that he had tried to make his paper as comprehensive as possible. He quite realised the value of Mr. Stanley's suggestions as to finishing the internal walls, which he had often heard before, and if he had more money at his disposal he should like to carry them out.

The PRESIDENT remarked that children housed in roughly completed buildings could not be expected to give proper attention to questions of colour and refinement of detail. He considered that the best enamelled tiles and bricks that England could supply should be employed on the wall surfaces of schools, so as to cultivate the tastes of the children. He knew by experience with students of another class how difficult it was to cultivate appreciation and observation of the things constantly before them—of simple shells, flowers, and leaves—and how more difficult the educational task became when scholars were constantly surrounded by quasi-ugliness.

#### THE ARCHITECTURAL ASSOCIATION DINNER.

THE close of the fifty-second session of the Architectural Association was marked on Wednesday evening by the annual members' Dinner held at the Caledonian Room, Holborn Restaurant. The chair was occupied by the President, Mr. G. H. Fellowes Prynn, F.R.I.B.A., who has just been elected to a second year of office, and who was supported by about ninety members and guests, including Sir Edward Clarke, Q.C., M.P., Sir Henry H. Howorth, M.P., Archdeacon Sinclair, Mr. Aston Webb, A.R.A., the Dean of

Bocking, Canon Porter, Dr. G. V. Poore, Alderman Hind, Messrs. T. Blashill, W. E. Riley, J. C. Preston, W. H. Seth-Smith, H. L. Florence, W. B. G. Lewis, E. T. Hall, W. White, B. F. Fletcher, F. W. Pomeroy, F. T. W. Goldsmith, H. T. Hare, &c. The toast of "The Queen and Royal Family" having been heartily honoured, the PRESIDENT proposed "The Church and the Houses of Parliament," remarking that the former had ever been most closely associated with architecture, on which she had had an incalculable influence, while their art in its catholicity and universality had exercised an equally great influence on the Church. In conclusion, the President touched on the decoration of St. Paul's, and while giving all credit to the Dean and Chapter, and to the talented architect, who had been actuated by the noblest aims and aspirations, and had executed his scheme with wonderful industry and enthusiasm, still, in all charity, he must say that in his recent letter to the *Times* Sir William Richmond had assumed a very haughty tone, or had put himself on a very high pedestal, and he must, as an architect, protest against so characteristic and national a building as the Metropolitan cathedral, designed, too, by one of the ablest of English architects, being spoiled and utterly ruined. The decoration of St. Paul's could only be successfully accomplished by a co-operation of architects and artists. Turning to the second part of his toast, the President declared against the way in which the House of Commons cut down the expense of every public building, a matter in which a little State like Belgium put us to shame. With the toast he coupled the names of the Ven. Archdeacon Sinclair and Sir H. Howorth. In his response, Archdeacon SINCLAIR remarked, amid laughter, that the modern churches were not so well built as those of former days; in his duty of inspecting in London various churches, he found the newer edifices were thinly built—due, doubtless, to insufficiency of means, and also badly ventilated; while in a large and new church in the East-end, planned by an eminent firm of architects, he found the doors so narrow that a coffin could not be brought in until the building had been altered. He eulogised the restoration of St. Saviour's, Southwark, and St. Bartholomew's, Smithfield, and the new church of St. Philip, Stepney, designed by the late Arthur Cawston. The present race of architects restored our churches in a conservative spirit; but in the "fifties" all work of the Queen Anne, Jacobean, and even earlier work was ruthlessly swept out of our churches by the eminent architects of the last generation; so that it was clearly not always wise to follow the advice of the leaders of the architectural profession, however eminent and unanimous they might be. As to St. Paul's, the Restoration Committee welcomed in the freest and frankest manner all honest and kindly-expressed criticism. Further, he felt that the Restoration Committee was somewhat too weak to bear the strain of so great a work, and he, for one, would welcome upon it some architects in sympathy with Wren's work, and one or two Academicians; certainly the P.R.A., the chief of the Ecole des Beaux Arts, and the corresponding official in Germany. Dr. Sinclair then entered at length into the history of Wren's work, and the schemes of decoration during the last quarter of this century. He, for one, should like to see a great part of the reredos, including the upper portion and the wings, removed, and all the modern stained glass taken out. Anyone who was appointed to carry out the decoration ought, he thought, to work in the spirit of Wren's ideas. Even if the original architect did commit some architectural mistakes, as he admittedly did in the curtain walls and quarter-domes, these should be left uncorrected. When the stencilled work had been taken off (and Sir W. Richmond had agreed to this course, although reluctantly), the result of the decorations would be, he believed, very satisfactory. Allowing for ignorance and exaggeration, the discussion had been a beneficial one, and the Restoration Committee honestly wished to do the best for the great building with which they were intrusted. Sir H. H. Howorth, in replying, admitted that in neither House was much encouragement given to art; but when a body was making history, they had little time or inclination to patronise art. He poured ridicule on the idea of Parliament appointing an ædile,—such a man, *e.g.*, as the late A. S. Ayrton—to pronounce judgment on proposed new buildings, and argued that the best

opportunity for architecture was unfettered freedom. Turning to decoration, Sir Henry argued that England had never, even in Mediaeval days, been capable of satisfactorily decorating her buildings, either with frescoes or stained glass. In proposing the toast of "The Royal Academy and the Royal Institute of British Architects," Mr. H. HEATHCOTE STATHAM commented on the fact that both these bodies were charged by outsiders with neglecting the poetic aspect of their art. Neither an Academy nor an Institute of Architects could create genius, but both could educate students and set a high standard of technique in their art, and this was done by the Academy in its schools and by the Institute in its scheme of examination and of prizes. With the toast were coupled the names of Mr. Aston Webb, the newest Associate of the Academy, and Mr. H. L. Florence, both past presidents of the Association, who were cordially greeted when responding. Sir EDWARD CLARKE, in proposing the toast of the evening, "The Architectural Association," referred to its work as the educational body of the profession, and to the influence and authority it had gained as the result of its fifty years' work on behalf of students. He congratulated the Association on having re-elected to the chair Mr. Fellowes Prynn, whose genius as a sympathetic and artistic church architect was widely appreciated, and who had carried for the speaker a commission of that character. The PRESIDENT replied in a genial speech, emphasising the value of the Association as the only body which really systematically carried on the education of architects, and he urged students to maintain their enthusiasm in the work of the classes, and appealed to the senior members of the profession to aid the Association's work by continuing or becoming members. The remaining toasts were "Our Guests," proposed by Mr. Beresford Pite, past-President, and responded to by Mr. J. C. Preston, Master of the Carpenters' Company, Alderman Hind, Master of the Plumbers' Company, and Dr. G. V. Poore; "The Lecturers and Instructors," given by Mr. Hampden W. Pratt, ex-President, and acknowledged by Messrs. H. A. Satchell and W. G. B. Lewis; "The Committee and Officers," proposed by Mr. F. T. W. Goldsmith, and to which Messrs. E. Howley Sim and G. B. Carvill replied; and "The President-Elect," given by Mr. W. H. Seth-Smith, and acknowledged from the chair. During the evening a number of songs were given in excellent style by Messrs. S. Constanduros, H. Passmore, Gervase Bailey, F. D. Clapham, and G. B. Carvill, with accompaniments by Mr. Leonard Butler.

#### THE SOCIETY OF ARCHITECTS.

THE last monthly meeting for the present session of the Society of Architects was held at St. James's Hall, Piccadilly, on Thursday evening in last week. Mr. H. G. Quartermain, treasurer, in the chair. The following new members were elected: Silvester Stevenson Atherby, 3, Clifton-terrace, Forest Hall, Northumberland; W. J. Blaylock Carter, 16, The Bund, Shanghai, China; and John Riding, Derby Chambers, Derby-street, Ormskirk. Six nominations for membership were read by the secretary, Mr. C. M'A. Butler.

#### SOME CHURCHES IN AND NEAR COLCHESTER.

A paper on "Some Essex Churches," illustrated by a large number of lantern slides, was read by Mr. G. GARD PYE, member. The lecturer explained that, on account of the fulness of his subject, he proposed to confine his remarks to a notice of the churches in the neighbourhood of Colchester. A good number of the churches in Essex—and more so round Colchester—are of Norman origin, being restored or rebuilt later on in the Decorated and Perpendicular periods—more in the latter than the former. St. Botolph's Priory, through being unfortunately between the fires of the besiegers and the besieged during the siege of Colchester in 1648, was reduced to its present ruinous state, and consisted of nave, central tower, transept, and choir. This is a remarkable instance of the use made of Roman materials for building, and singularly enough these materials were used for the ornamental part, as can be seen in the west front. The bricks used were of the 4th century, and some even earlier. When the Royal Archaeological Society visited this building in 1877, several members pointed out some bricks that were as

early as the 1st century, being only 1in. in thickness. The west doorway is a good specimen of a Norman arch, with its zigzag or chevron, and billet mouldings, with a rude hood mould formed of tiles, and the interlacing arches from which it is said the Gothic arch of later years took its form; but I think this is theory only. The gateway is all that is left of the once large and handsome abbey of St. John, dating from the time of Henry II., and has been truthfully restored some years back by Major-General Montagu, Royal Engineers. Fortunately for him, one of the pinnacles was discovered buried in a wall, and from this clue he was enabled to add the others. In the priests' doorway in the ruins of St. Nicholas' Church at Colchester, you again see the introduction of Roman bricks re-used from some old building that had been pulled down. These ruins have given place to a new church that was designed by the late Sir Gilbert Scott. A very interesting specimen of a Saxon doorway is in the tower of Holy Trinity Church, Colchester. Here we have another example of the introduction of Roman brick, and the primitive idea of ornament in the rude formation of the shaft, with cap and base, with the hood mould, and, as a sign of the religious revival, the formation of the cross in the key of the arch. Ardleigh Church, some four miles from Colchester, is a specimen of an ordinary Essex church, Perpendicular in style, with its tower, nave, aisles, and chancel. The porch contains some fine work in flint and ashlar work. The churches of East Anglia are different from those in the West of England, though there is much Perpendicular work in each, the style being largely ruled by the materials at the disposal of the builders. Here there was little stone to be obtained, and they had to use flint, with facings of fine stone, which is the characteristic treatment of the district. Great Bromley Church is another good specimen of an Essex Perpendicular church. The nave roof is very elaborate, having double hammer-beams, richly carved and picked out in vermilion. This church stands in the beautiful vale of Dedham, was the subject of one of Constable's paintings, and was built by a father and his sons, whose marks still remain in the tower. In this church, on the south side of the chancel, is an oven with flue complete for the baking of sacred wafers, the only instance, I believe, in England of an oven in a church. The stairs to the rood loft still remain. The north porch has a narthex or room over, used either for storing parish documents, or as a library to store those books given to the parish, as in those days books were scarce, and such a gift was in consequence valuable. When these rooms had a fireplace in them and a window opening into the church, they were usually used as watching-rooms and chambers. Lawford Church has an interesting group of chancel windows of an earlier period than are mostly to be found in this part of Essex. Internally are some elaborate stone carvings. It is said of this church, but I will not vouch for the truth of it, that an amusing tale is told. It was many years ago the custom for the rector to wait until the squire of the hall adjoining had arrived before he began the service. One Sunday, being later than usual, the rector began with the usual opening sentence, "When the wicked man—" The old clerk jumped up and said, "Please, sir, he baint come yet." Higham Church, Suffolk, contains a specimen of a priest door and chancel window. Another fine Perpendicular church across the border in Suffolk is at East Bergholt, with unfinished tower. The bells hang in a cage in the churchyard. There are several brasses and tombs in this church, and a window to the memory of the painter Constable, who was born in this village, and here painted many of his pictures. The north porch of Boxford Church, also just over the Stour in Suffolk, is one of the oldest wooden porches in England unrestored. The south porch is of stone, which must have been brought from some distance, as there are no quarries anywhere near. The ceiling is very handsomely groined. There is a good specimen of a Late Perpendicular door richly carved and moulded, and also a very handsome screen of stone in this church. Little Oakley Church contains a curious feature, a priest-door being pierced in a buttress. Great Bentley has a good specimen of a Norman door, with its zigzag and rose mouldings. There are several other Norman features in this church, including five windows. The staircase to the rood still exists. Fingringhoe has a Perpendicular porch, built in rubble work, finished with flint

and stone in the parapet. In the spandrels are the Archangel Michael and the Dragon, evidently symbolical of heaven and hell, since the church is dedicated to St. Andrew and not to St. Michael, as these figures would lead one to suppose. This church was considerably damaged by the earthquake in 1884, and has since been restored. There are some interesting frescoes, including one of St. Christopher carrying Christ over the river of the waters of life, and an old oak chest, richly carved. Langenhoe Church was entirely destroyed in the earthquake of 1884, and has since been rebuilt. Brightlingsea Church contains good specimens of Perpendicular work, although it is clear that from the buttress level with the chancel, which is of earlier date than the rest, that it is a 14th-century church changed at the end of the 15th as regards the aisles with battlements, and the tower added. The late Prof. Freeman describes this tower as being one of the finest of its kind in existence. Frating Church has an old oak porch with an open roof. Berechurch is a curious old church prettily situated in a park. It is difficult to account for the large window that has been inserted. The church at Copford was undoubtedly of Norman origin, having a vaulted roof, but the destroying hand of time obliged the substitution of a wooden roof, which by archaeologists is acknowledged to be a beautiful piece of work, and much admired by the late Sir Gilbert Scott. The walls, which are very thick, were mostly built of Roman brick. The noted features of this church are its frescoes. In the apse Christ is represented seated on a throne with a rainbow behind, and clouds under His feet, His right hand in the attitude of benediction, and His left resting on a book, the wounds being visible in the hands and feet; below are angels, and in the background the towers of New Jerusalem. On each side stand four apostles under canopies. Excepting the chapel in Canterbury Cathedral, the late Sir Gilbert Scott said in his whole experience he had never seen anything to compare with it. The south porch to the same church is considered by Sir Gilbert Scott to be the most beautiful specimen of a Decorated wooden porch in the country. The door leading from the porch to the church was covered with the skin of a man who had been caught in the act of sacrilege.\* Close by is the famous Tower of Layer Marney, with its terracotta work, but as it is a domestic building it is out of my province in this paper to describe it fully; but it is well worthy of a visit should any member of the Society be in the neighbourhood. Marks Tey is a 13th-century church, curious in its having the upper portion of tower of wood. Great Tey Church is very interesting, with its Norman tower heightened at a later period. The plan of this church was cruciform, the nave and chancel being rebuilt in the Early English and Decorated periods. The old wooden porch to Aldham Church is of the Decorated style, mentioned and illustrated by the late J. H. Parker in his "Glossary of Gothic Architecture." Bures Church, like that of Little Oakley, has the buttress of the chancel pierced for the priest-door, another good specimen of East Anglia Perpendicular work. The south porch is a good specimen of a treatment in brick, but of course is of later date than the church itself. Mount Bures Church is another specimen of a Norman tower, but heightened, as you will see, a few centuries later. Coggeshall has a fine Perpendicular church of large proportions, the interior being richly carved. It is the largest church in Essex. Little Maplestead was originally attached to the Rectory of the Knights of St. John of Jerusalem, founded here in the time of Henry I. Though restored in 1854, it is still of special interest as being one of the four remaining round churches in England built on the model of the Holy Sepulchre; the others being the Temple Church, London; St. Sepulchre, Northampton; and St. Sepulchre, Cambridge. The chancel is an apse; the nave is circular, with peristyle of six clustered columns; the western entrance has quatrefoil border. This church is said to have had the privilege of sanctuary. I have now completed my paper; but before I conclude I should like to thank my friend, Mr. John Bettison, a retired naval officer, who takes a great interest in photography, and who has kindly prepared the slides from the photographs I took myself when in my articles, some thirty years ago,

\* Since writing this paper a friend has kindly forwarded to me a copy of the supplement to the *Tablet* of the 13th inst., in which this church is very fully described and illustrated by Mr. Dudley Baxter, B.A.

before the hand of the restoring architect had touched most of them.

At the close of the lecture a vote of thanks was accorded to Mr. Gard Pye, on the motion of Mr. SEABRIGHT GREEN, seconded by Mr. G. A. T. MIDDLETON, and supported by Messrs. S. W. KERSHAW, F.S.A., J. R. MANNING, ELLIS MARSLAND, W. COOPER, A. A. ATKINS, and the Chairman.

#### THE EXCAVATIONS AT SILCHESTER.

AN exhibition has been opened this week at the rooms of the Society of Antiquaries in Burlington House of the objects brought to light during the operations of the Silchester Excavation Fund last season between May 2 and November 26. The area examined consisted of eight acres in the extreme south-west corner of the city, and the finds have not been so numerous as in some former years. The principal discovery is a large mosaic pavement found in one of the rooms of an old house in *insula* 19, which is quite different from anything hitherto found at Silchester. The room in which it occurs measures about 15ft. by 20ft., and one-half or two-thirds of the pavement remain. It is executed in Purbeck marble, hard chalk, burnt brick, &c. Along one side of the room there is a passage ornamented with a woodbine pattern, black on a white ground, while round the central part, which is decorated with panels containing beasts and busts, there runs a scroll pattern of flowers and leaves, with a strong general resemblance to several known at Pompeii. The house from which it was obtained was an early one, for a part of it was overbuilt by another house, itself of early date and of the largest size, with fine hypocausts. In a workshop attached to this some industry had been carried on. Other exhibits include earthenware vessels, pieces of plaster painted to imitate various kinds of marble, a pair of handcuffs with a lock, a set of hooks, a scone, enamelled brooches, fibulae, intaglios for rings, and pins with bronze and glass heads. The exhibition remains open till Saturday in next week, the 10th inst. In the current year the committee propose to turn their attention to the other side of the city, and excavate two *insulae* in the northern part, lying to the east of the portion examined in 1890.

#### CHIPS.

On Thursday, June 8, the annual meeting of the Royal Architectural Museum will be held at four o'clock, when the President, the Duke of Westminster, will take the chair, and Sir Wyke Bayliss, P.R.B.A., will deliver an address to art students on contemporary matters connected with their work, under the title of "The Bogey in the Studio." The gathering will be free, and will take place at the School of Art in Tufon-street, Dean's-yard, Westminster.

Mr. W. O. E. Mead-King, C.E., on behalf of the Local Government Board, conducted an inquiry at the Town Hall, Dudley, on Friday, respecting the application of the Corporation for sanction to borrow £1,425 for various public improvements, including £500 for a warehouse for the market-stalls, £300 for the erection of a weights and measures office, and £300 for a public mortuary in Stone-street.

The Eye and Ear Infirmary, Portsmouth, is being warmed and ventilated by means of Shorland's patent Manchester Grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. A. J. Wood, 22, Surrey-street, Strand, has been appointed architect for extensive additions and alterations to the Norfolk County Asylum at Thorpe, near Norwich.

Mr. Robert Hope, contractor, of Sheriff Hill, Newcastle, died on Monday from the effects of a fall from his horse while riding up High-street, Gateshead.

The memorial stones of a new Primitive Methodist Chapel were laid at Penzance on Monday. Mr. Oliver Caldwell is the architect, and Mr. J. Tucker the builder. The edifice, which is to seat 400, will cost £1,400, and is being built on the site of the old chapel in Mount-street.

A bandstand erected in Aston Park was formally presented to the Birmingham City Council on Saturday. The bandstand, which was designed by Mr. Arthur Edwards, of Bennett's Hill, Birmingham, is octagonal in shape, and is 22ft. in diameter. It rests on a base of King's red bricks, with York stone coping, and has cast-iron columns, with circular cast-iron spandrel, supporting an overhanging pyramid roof, 30ft. in diameter.

## OBITUARY.

By the death of Mr. ALEXANDER FRASER the Royal Scottish Academy has lost one of its oldest members. For the last ten or fifteen years Mr. Fraser has been virtually laid aside by advancing age and bodily infirmities, but a couple of his latest canvases were to be seen in the exhibition of the Scottish Academy, which closed on Saturday. He was born in 1828, at Woodcockdale, near Linlithgow, being the son of an able amateur artist, and on leaving Lanark Grammar School he was sent to Edinburgh to study drawing in the Gallery of Arts. Afterwards he was admitted to the School of Design, and while engaged there he also employed much of his time copying pictures in the Scottish National Gallery. His first appearance in the Royal Scottish Academy's Exhibition was with a figure picture, entitled, "A Gipsy Girl in Prison"; but he soon turned his attention to landscape, and in that department with success. From the year 1858 he appeared regularly in the Royal Scottish Academy exhibitions. In 1858 he received recognition from the Academy by being elected an associate; and four years later was raised to full membership, on which occasion he painted as his diploma work a landscape entitled "At Barncleugh." Most of his pictures were painted in the open air.

Mr. THOMAS COOKE NICHOLSON, F.R.I.B.A., F.S.I., of Blagdon-on-Tyne and Grange-street West, Newcastle, whose remains were interred on Monday at St. Patrick's Churchyard, Winton, was the author of an exhaustive description of St. Mary's Cathedral, Newcastle. Previous to becoming architect to the proprietors of the Towneley Estates, he was in practice in Newcastle. As an architect Mr. Nicholson was keenly interested in the progress of his profession. He joined the Institute of British Architects and the Surveyors' Institution, in both cases as a Fellow, in the autumn of 1891.

Mr. ABRAHAM GRAHAM, of Bankfield House, Bankfield-road, Huddersfield, and head of the firm of Abraham Graham and Sons, contractors, Longroyd Bridge, Huddersfield, died on Saturday morning at his residence at the age of 66 years. The firm of which he was the principal controller is probably the largest engaged in the building trade in the Huddersfield district, and he was well known in the West Riding. The town-hall was erected by his firm, and he was also responsible for the building of the new sanatorium at Mill Hill; High-street Methodist New Connexion Chapel and Schools; the Halifax and Huddersfield Joint Stock Bank at Huddersfield; and the present extensions to the Huddersfield Technical College. On railway and public works Mr. Graham was engaged at Sheffield, Mirfield, Heckmondwike, and Lockwood, and he carried out the scheme of intercepting sewers for the corporation. He was not conspicuous in public affairs, although at various times he was connected with the town council and the board of guardians. His resignation as town councillor was due to having undertaken contracts for the corporation. He leaves a widow, five sons (all of whom were associated with him in his business), and four daughters.

Mr. R. H. Bicknell, M.Inst.C.E., Local Government Board Inspector, held an inquiry on the 27th inst. with respect to an application by the town council of the county borough of South Shields for permission to borrow the sum of £2,888 for the provision of a branch police and fire-station and a branch public news-room at Laygater-lane district, within the borough. Mr. S. E. Burgess, M.I.C.E., borough engineer and surveyor, explained the plans and other details of the scheme.

The Royal Arcade near the market-place at Norwich was formally opened on Thursday in last week. It runs from the Gentleman's Walk to the Back-of-the-Inns, and Doulton's Carrara ware has been largely employed for fancy and decorative purposes. The arcade is 29ft. in height and 15ft. wide, is lighted by electricity, and contains twenty shops. It has been erected from designs by Messrs. G. J. and F. W. Skipper, architects, London-street, Norwich.

A statue of the late Lord Aberdare, who was Home Secretary in Mr. Gladstone's first Government, and first President of the University College of Wales at Aberystwith, was unveiled at Aberystwith on Friday, by Sir Lewis Morris. The statue is a replica of the original in bronze erected some months ago at Cardiff, and has been presented to Aberystwith College by the designer, Mr. Herbert Hampton.

## Building Intelligence.

COLWYN BAY.—The first pile was driven on Monday last, May 29, for the new pier. The work is being carried out from designs by Messrs. Mangnall and Littlewoods, Manchester, the Widnes Foundry being contractors for the first section including the pavilion, which has to be completed by the end of this year. The pier promenade leading to the pavilion will be 40ft. wide, and is constructed with iron piles placed at intervals securely braced together, supporting steel riveted girders of spans that are considered strong without any extravagant use of metal, based on experience gained in the construction of two piers and pavilions recently erected at Morecambe. The pavilion is situated 50 yards from the entrance to the pier on the right-hand side, having a large dome and campanile towers, treated in the Renaissance style, calculated to hold about 1,500 persons. Gallery, cloakrooms, lavatories, and shops are provided. It is intended next year to complete the second section, which will comprise the continuation of the pier to 350 yards in length and 30ft. in width, the extremity being widened out for open-air music and other entertainments.

TRURO.—The preliminary work in connection with the completion of Truro Cathedral is being pushed forward as quickly as possible. The clerk of the works, Mr. E. T. Price, late of Bournemouth, has taken up his abode in the city, and under his direction offices, workshops, trestles for steam cranes, and other necessary work has been carried out, and the actual building operations have been commenced this week, preceded by a religious service held on Monday. As far as practicable, preference will be given to local labour. The builders, Messrs. Wilcock and Co., of Wolverhampton, are allowed 3½ years to complete the work, and during that time between 200 and 300 men will find constant employment on the work.

WALTON-ON-THE-HILL, LIVERPOOL.—Miss Ryle laid on Friday the foundation-stone of the new church of St. Luke the Evangelist, Walton-on-the-Hill. The church, when completed, will provide 564 sittings, and the present contract is for £4,500, which will cover the cost of erecting the shell of the building. The building is to be of brick, with stone jambs and mullions to windows, with Ruabon brick quoins and bands and terracotta finials, &c. The style is Early English. The architect is Mr. J. Francis Doyle, whilst the contractor is Mr. Samuel Webster, and the clerk of the works Mr. Gilbert Morris.

## CHIPS.

A consulting engineer and his son, of Birmingham, have secured British and international protection under the Patent Acts for an invention entitled "a mechanical bricklayer," for use in automatically laying, cementing, and levelling bricks, slabs, stones, and the like, in buildings of every description. The inventors expect to save two-thirds of the time occupied in laying bricks by hand.

At a meeting of the Malmesbury Abbey Restoration Committee, held on Wednesday week, it was stated that the estimated cost of the works needed for repairs was £10,000, towards which £1,685 had been promised. It was decided to invite a limited number of firms of builders to send in tenders, and a sub-committee of three was appointed with power to accept a tender.

At the Tonbridge Police-court, on Tuesday week, the adjourned case against Mr. Henry Adams, builder, of Monson-road, Tunbridge Wells, his son, George, aged 18 years, for committing wilful and corrupt perjury, was heard. The summonses were taken out by Messrs. William L. Bradley, surveyor to the Tonbridge Urban District Council, and related to a charge of alleged contravention of local by-laws as to drain connections. In the event both cases were dismissed.

The new Jamaica-street bridge at Glasgow, replacing one by Telford finished in 1836, was publicly opened upon the Queen's Birthday. It is 22ft. wider than the former structure, or 80ft. in width, and has cost about £100,000. Messrs. Morrison and Mason, of Glasgow, were the contractors, and the work has been four years in progress.

On Saturday there was erected in the Abbey Churchyard, Jedburgh, a monument of Aberdeen granite in memory of Mr. James Watson, historian of Jedburgh Abbey. Mr. Watson's volume on the history and architecture of Jedburgh Abbey is recognised as a work of comprehensive and careful research and of good literary character.

## PROFESSIONAL AND TRADE SOCIETIES.

EDINBURGH SOCIETY OF ORDAINED SURVEYORS.—The inaugural dinner of this Society was held in the Royal British Hotel, Edinburgh, on Friday night, and was attended by over thirty members. Mr. Peter Lawrence, President of the Society, occupied the chair, and the croupiers were Mr. A. Lawrie and Mr. R. Hamilton Paterson. The loyal toasts having been honoured, Mr. W. W. Robertson gave the toast of the evening, "The Society of Ordained Surveyors." The society was, he said, established for the purpose of promoting the interests of the profession, and he noticed from their rules that they proposed first to concern themselves with the establishment and conduct of examinations in connection with the qualification of candidates for admission to the society, and through the society to the profession. That, he thought, was in itself a very large and important piece of work, and it had a very direct bearing upon the standing of the profession in the future. The chairman, in replying, also referred to the regulations that had been drawn up by the society. Of course, he said, the surveyors wanted to get the best charges they could, and he thought this society would be helpful in this. They had been doing what they could to get a regulation mode of measurement adopted, which, he trusted, would satisfy architects as well as builders. He then proposed "The Ordaining Authorities," which was acknowledged by Bailie Robertson and Councillor Cameron. Mr. Paterson gave "The Builders," Mr. Edward Bruce responding. Mr. F. H. Lightbody, the hon. secretary, replied to the toast of "The Office-Bearers."

## LEGAL INTELLIGENCE.

CARNARVON.—THE ARBITRATOR'S AWARD.—Mr. Robert Vigers, the umpire in the arbitration case between the Carnarvon Corporation and Mr. Lloyd W. G. Hughes, Coedhelen, respecting the value of the ancient ferry rights over the river Seiont, at Carnarvon, has forwarded his award to the town clerk. The corporation are erecting a bridge over the ferry, and require land on the Coedhelen estate, to the extent of 290 square yards, for the purposes of the approach. In the course of the arbitration proceedings the corporation called evidence to prove that the value of the ferry and the land was about £500, while the witnesses called on behalf of the estate valued it at £4,000. The umpire has awarded the sum of £2,079 to Mr. L. W. G. Hughes as compensation.

WORKMEN'S COMPENSATION ACT.—At the Birmingham County-court, on Monday, two applications were made under the Workmen's Compensation Act to fix the amount to be paid to Ann Peyton for the death of her son, and to Mary Stokes for the loss of her husband, the two men who were killed during the demolition of Christ Church on Feb. 7. In the first case it was stated that the mother was partly dependent on her son's earnings, but His Honour Judge Whitehouse held that the members of the family must be wholly or partly dependent upon the man's earnings at the time of the death. Mrs. Peyton admitted that she had not received anything for six months, and therefore, while he felt the keenest sympathy with her, he regretted that he must not suit her. In the case of Mrs. Stokes he awarded £187 compensation—£100 to the widow and £87 to her twelve-year-old daughter.

The architect's plans and specifications for new Hall of Records for New York have just been issued. They require two million dollars to be spent on the external building proper, and two and a half million dollars additional to complete the interior. The estimate for sculpture is 85,000 dollars, and for mosaic work is 10,000 dollars. No wood whatever will be used, the interior being entirely of coloured marble and the window frames of copper.

The decoration committee of St. Paul's have decided to remove the stencilling, and that it is desirable, before proceeding to do so, to see what will be the best mode of finishing the arches by completing the south-west dome without any decoration of the flat stone work. It has also been agreed that the panels in the fourth quarter-dome shall not be proceeded with until the committee have seen the effect of the whole of the south-west section being so treated.

The city council of Ripon have unanimously resolved to instruct their water supply committee to proceed with their inquiries respecting the proposal to purchase of the Marquess of Ripon the sulphur water spring, Aldfield Spa, and to present at the next council meeting plans and estimates of the cost of bringing the water to Ripon, and the erection of the necessary baths and other buildings.

SELECTED DESIGN FOR THE ROYAL INSTITUTION, LIVERPOOL.—CAVENHAM HALL, SUFFOLK.—ARTISTIC WALL-PAPERS BY JEFFREY AND CO.—HOUSE AT APSLEY HEATH.—VICTORIA JUBILEE JUNIOR SCHOOL, BYKER.—FURNITURE FROM THE HOME ARTS AND INDUSTRIES EXHIBITION.—ORNAMENTAL IRONWORK.

## Our Illustrations.

THE ROYAL INSTITUTION, LIVERPOOL.  
SELECTED DESIGN.

THE design illustrated herewith was placed first in the recent open competition for the entire reconstruction of these buildings for the Royal Institution, Liverpool. It is the intention of the committee to first proceed with the building of the large lecture hall and retiring rooms, using them in conjunction with the existing premises. These, when funds allow, will be pulled down, and the scheme completed as shown by the drawings. The problem to be solved in the plan was to allow the hall to be easy of access and convenient to the existing buildings, and also admit of a similar arrangement when the completed scheme came to be carried through. The large lecture hall will accommodate 1,100 on the ground floor and 150 in the end gallery. The completed scheme provides for a small lecture theatre for 500, and has also top-lighted sculpture and picture galleries on the first floor. It is intended to use red pressed brick with terracotta dressings for the façades; the roofs to be slated. The estimated cost of the entire scheme is £18,000. The architects are Messrs. Briggs and Wolstenholme, of Liverpool and Blackburn. The plan, section, and elevation fully illustrate the provisions of the undertaking. Besides the top-lighted sculpture gallery and other galleries for pictures, there will be rooms for society meetings contrived on the first floor; the library to be at the corner of Colquhitt-street also on the first-floor level.

CAVENHAM HALL, SUFFOLK.

THIS house, which is now in course of completion, has been built on a large shooting estate not far from Bury St. Edmund's. The old mansion-house, situated in the lower portion of the park, has been used for housing the workmen during the erection of the new hall, which has been placed some 300 yards to the south-west, on more rising ground. On the finishing of the stable buildings and gate lodges, the old hall will be entirely pulled down by the contractors, Messrs. Waring and Gillow, Ltd. The house has been built of dark-red narrow bricks, averaging five courses to the foot, supplied by Messrs. Allan and Co., of Sudbury, and the stone facings are of Casterton stone; the main cornices are of deal lined with lead to form the gutters, and the roofs have been covered with tiles supplied by the Brosely Tilery Company. The lifts have been supplied by Messrs. R. Waygood and Co., Ltd., and the internal ornamental plaster-work by Messrs. George Jackson and Son. This drawing is now on view at the Royal Academy, and Mr. Andrew N. Prentice, A.R.I.B.A., is the architect.

## ARTISTIC WALL PAPERS.

MESSRS. JEFFREY and Co., of Islington, have long obtained a considerable reputation for the designs which they have brought out for wall and ceiling decoration. To-day we have made a choice of some of this firm's new patterns, executed for the present season and for next year. Mr. Walter Crane is the author of the very lively and picturesque composition entitled the "Cockatoo and Pomegranate," and Mr. Heywood Sumner's "Ribbon and Rhododendron" design also figures on the same sheet. This paper is rendered, of course, like most of the others, in a variety of colourings; but in all the space is admirably covered with well-drawn forms and well-defined spacings. "The Cardiff" is excellent in its sweetness of line, and although a very definite pattern, it cuts up exceedingly well in half-widths in narrow spaces. This can be seen at once by placing a piece of paper over one side of the design. The foliations, in a good red terracotta on a pale cream ground, well adapt this pattern for many uses, and it is very effective in execution. The Adams ceiling shown in the centre of our sheet reverses in hanging, and produces a bold and handsome arrangement in refined detail. The Oxford ceiling-paper is less mannered, working within the narrower limits of 21 in. per square. The same restriction is observable in the "Stud" ceiling in relief. Mr. Lewis F. Day is the author of several of Messrs. Jeffrey and Co.'s most successful patterns. A whole book is devoted to Mr. Heywood Sumner's designs, which have a quaint directness and decorative character essentially their own. Some would feel their mannerism a difficulty, while others will in this recognise a special charm. The "Oak and Ash" is one of the best, well adapted in reds for dining-rooms. The "Campden" and the "Crown Imperial" are specially bold. The "Plantain" is a powdered diaper in graceful ovals, tracery-like, over the whole surfaces, while the "Knapweed" makes another elementary sort of design gracefully composed. The Floral Trellis is very pretty. We have only noted some of the most novel. The variety is so endless that it is impossible to name them all, and then Messrs. Jeffrey's variations in colour greatly augment the available choice adapted for every requirement of good taste.

RESIDENCE, APSLEY HEATH, NEAR BEDFORD.

THE above house has been erected on a charming site on the outskirts of the Woburn Estate, and in the midst of exquisite woodland scenery. The lower part is built of red sand-faced brick, and the upper part of stucco, and covered with a red tile roof. The work has been carried out by Messrs. Spencer, builders, Bedford. The architects are Messrs. Brewill and Baily, Pelham Chambers, Angel-row, Nottingham.

VICTORIA JUBILEE JUNIOR SCHOOL, BYKER,  
NEWCASTLE-ON-TYNE.

THIS school, which was recently opened, was erected to provide accommodation for 840 junior scholars. The buildings are of local stone, simple in character, and designed to harmonise with the older school buildings on another portion of the site. Internally, the school is finished with high-glazed brick dadoes and plaster above, with pitch-pine to 1st floor and plaster to ground-floor ceilings. The school is heated on the low-pressure hot-water system, and ventilated by means of shafts carried up to exhaust turret on roof. The work was carried out by Mr. Alex. Pringle, contractor, Gateshead, under Mr. Boocock as clerk of works. The architect was Mr. Charles Walker, of Eldon-square, Newcastle-on-Tyne.

THE HOME ARTS AND INDUSTRIES ASSOCIATION.

THE annual exhibition of this useful society has just closed at the Albert Hall. To-day we give a sheet of sketches from the gathering of Arts and Crafts Exhibits shown on the above occasion at South Kensington. The Oak Cabinet designed by Mr. W. H. Heady obtained a gold star, the highest award in the exhibition, and, like the Escritoire from the same hand, was made at Mrs. Leopold de Rothschild's School at Ascot, Leighton Buzzard. The Cabinet Doors are delicately carved in a sort of teazel pattern; the handles, &c., are of beaten copper. The Escritoire is of oak, stained a deep green, the upper portion being skillfully inlaid with a tulip and foliated design. Eight recesses occupy the upper part, as shown by the second sketch, with the flap

open. Immediately the exhibition opened this piece was bought by Lady Lovelace, and the Princess Louise ordered another of similar design. The council report another material advance in the progress of the association, as during the year 27 new classes were started. The average standard of work is higher, and the experience gained in former years is now bearing fruit. The stronger classes have developed so much as to make their endeavour felt by wishing to be established as a trading industry. The determination of the central authority to avoid, at any rate in headquarters, a commercial enterprise is of prime consequence; but in agricultural districts and in Ireland a class called "Developed Industries" is to be tried with a view of meeting the difficulty referred to. Woodwork, metalwork, basket-making, leather-work, embroidery, and pottery, besides minor classes of work, continue to occupy the energies of the various classes which are now established in all parts of the three kingdoms.

## EXAMPLES OF OLD IRONWORK.

THE accompanying illustrations of old ironwork are mostly taken from South Kensington Museum. The wrought-iron hinge is from an oak door removed from an old house near Exeter, and is of a form very much in use at that time (about 1600). The door-handle to the left is from Chastleton House, Gloucestershire. The hammered iron escutcheon is a fine example of German workmanship; but the door-handle strikes one as not being quite so comfortable to grasp as the simpler English ones, which seem better adapted to their purpose. The bolt-plate in the form of a crowned F (the initial of Francis I.) is cut out of one piece, the bolt itself sliding in the middle bar of the letter which is pierced for that purpose. W. HODGSON BURNET.

## COMPETITIONS.

LEAMINGTON.—For the proposed free library, school of art, and technical institute, nine sets of plans have been sent in, and have been numbered and forwarded to the assessor, who will report upon them by the end of next week.

LEICESTER.—A short time since the Markets Committee invited architects practising in Leicester to prepare designs in competition, and offered premiums of £100, £50, and £25 for the three best designs. Messrs. Leeming and Leeming were appointed assessors, who made the awards as follows: 1st premium (£100), Mr. Walter Brand, A.R.I.B.A., 16, Bishop-street; 2nd premium (£50), Mr. A. Bird, A.R.I.B.A., Grey Friars; 3rd premium (£25), Messrs. Blackwell and Thomson, Bedford Chambers; all of Leicester. The assessors state they have carefully gone into the estimate of the 1st premiated design, and make the result practically the same; which is as follows: markets, £24,087; cow storage, £6,417; baths extension, £1,329; total, £31,833. The recommendation of the Markets Committee to the Council that they authorise them to appoint Mr. Brand to act as architect was adopted last Tuesday.

The ceremony of laying the memorial-stone of the new wing of the British Home for Incurables, at Streatham Common, was performed on Tuesday. The object of the new wing, which will complete the Home as originally intended, is to provide accommodation for both inmates and staff, and also a recreation-hall. The architect is Mr. E. T. Hall, F.R.I.B.A.

At Loddon, Norfolk, a Primitive Methodist chapel is being built at a cost of about £1,000, to seat 200 persons. Messrs. Verridge and France, of Wisbech, are the architects, and Messrs. Chaston and Grimston, of Loddon, are the builders.

The directors of the Comrie, St. Fillans, and Lochearnhead Railway have accepted the offer of Messrs. John Paton and Company, contractors, Glasgow, for the construction of the section of the line between Comrie and St. Fillans, some six miles long. The contract price is over £78,000.

You want to read George Griffith's new story, "BROTHERS OF THE CHAIN," in the *Weekly Times and Echo*, don't you? Better order that paper for June 18 at once of your newsagent, then, or you may miss the first chapter. You remember the demand for his "Angel of the Revolution," "Olga Romanoff," "The Outlaws of the Air," and "The Romance of the Golden Star," and how you couldn't rest till you got *Pearson's* every week to read them. This is as good as the best of them—some say better.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLVI., XLIX., LI., LII., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 90c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publishers.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

RECEIVED.—D. G. J.—A. S. M.—G. G. and Co.—W. L. (Salford).—R. B. G.—N. R. Z.—G. T. L. Co.

## "BUILDING NEWS" DESIGNING CLUB.

## NINTH LIST OF SUBJECTS.

I.—A pair of semi-detached Suburban Villas in brick and stone on 28ft. frontages, each suitable to let at £60 a year, and carry a £10 ground-rent. Depth of land 100ft. The two parlours to be commodious, the larger of the two to be used as the dining-room; five bed-rooms, box-room, bath-room, and w.c. inside the house, besides servants' w.c., good kitchen, scullery with copper, larder, small store, and offices. The staircase is not to front the main entrance, and the hall must be 6ft. wide. Pitch of ground floor 9ft., upstairs 8ft. 6in. Two or three rooms may be on second floor. The problem has often been solved, but still ever-varying chances of distinction are afforded. Plain, simple, and picturesque treatment desirable, adapted to the materials used and object of the buildings. Tiles for roofs set out to 45° slope. Plans, two elevations and section, also sketch. Frontage 15ft. from footway. Scale 8ft. to the inch; but, if necessary, plans may be smaller, say 1/16th scale. Economy and spaciousness to be considered. State price and cubing. View necessary.

DRAWINGS RECEIVED.—"Cantab," "Lucky Star," "Swan," "Speys," "Astragal."

## Correspondence.

## VAUXHALL BRIDGE AND OTHER THINGS.

To the Editor of the BUILDING NEWS.

SIR,—When I read the report of Mr. Statham's paper in the *Institute Journal* and looked at the "copyright" design for the proposed Vauxhall Bridge, I was astounded that any architect, even an "eminent" architect, could have the daring to present such a design, aided also, be it said, by another design by his assistant, whose name, by the bye, he has the candour to publish.

Before I saw Mr. Woodward's admirable letter to you on the subject, I had compared the

designs advocated by Mr. Statham, and, indeed, had made two rough sketches, one showing Mr. Statham's arrangement of the voussoirs, and also the proper method of arranging them both constructionally from a mason's point of view as to satisfy the eye of an ordinary onlooker.

The "copyright" design is wrong in every point; and, finally, to cap the whole thing, the lamps are placed on the *piers* of the bridge! instead of being placed over the centre of the arches, so as to guide the navigation of craft. I should hardly think the author of this "copyright" design had ever been upon our crowded "London river" (as the sailors term it) by night. If so, he would know that the arch lights on the bridges enable lightermen and others in charge of craft to "shoot" the bridges with safety—a pier or buttress light would mean destruction to them in a river. If this is the architects' idea of a bridge, then I say, Pray leave such things to our friends the engineers.

Another point I must refer to in Mr. Statham's valuable paper is that he said he did not know who designed the Tower Bridge. Many of us do not know who really designs public monuments; but I think it is "common knowledge" to whom the design of this bridge is accredited—viz., the late Sir Horace Jones. This point was cleared up by Mr. Henry Lovegrove informing the meeting of this fact; but, of course, mere practical architects are not known to persons who dub themselves "eminent architects," for, referring to Mr. Statham's paper on page 393, he says, speaking of this handsome bridge: "It is stated that the exterior clothing was designed by an architect; he cannot have been a very eminent one as we never hear his name (!)" O! wise young judge—"We never hear his name"—this in one sentence sums up all the actions of the Institute. "We never hear his name": he cannot therefore be either eminent or gifted, as he is unknown to that small family party.

I cannot understand why Mr. Statham finds such fault with the Tower Bridge; doubtless, like his own elegant design for Vauxhall Bridge, it is in many points false in construction; but I can assure Mr. Statham that this bridge commands much appreciation by the public, and especially by foreign visitors, and will continue to do so long after Mr. Statham and all his "educating" designs are forgotten—if, indeed, they were ever known publicly.

The Tower Bridge should be seen from a vessel coming up the river, or moored alongside a wharf, about four or five o'clock on a fine summer's morning; then, indeed, it is a picture for an artist's—not necessarily an architect's—eye; the whole of the upper part of the eastern side of this commanding bridge lighted up by the rapidly-rising sun, touching up and glinting upon the bright points, the "atmosphere" still hanging over the river; the mass of craft of all kinds, and, above all, the active human life busily engaged, make up such a picture that might cause any man, even an architect, who don't know quite the reason why, to have some sort of elation, some sort of appreciation of a grand and noble picture.—I am, &c.,

HORACE T. BONNER.

## CIRCULARISING.

SIR,—I inclose herewith a circular which came into my hands to-day, thinking, if you can find room for it in the BUILDING NEWS, it may be of interest to some of your readers.—I am, &c.,

J. BATTYE.

T. J. COUNCELL, P.A.S.I., Architect and Surveyor, Valuer, and Estate Agent, 2, Queen Anne Buildings, Baldwin-street, Bristol, May 29, 1899.

DEAR SIR,—Will you kindly allow me to introduce myself to your notice, as I have a few facts to tell you which I am sure you will be good enough to consider?

I am a young architect and surveyor who has decided to start out in life, and, if possible, to attain to my motto—"Success with Honour."

I shall not charge exorbitant [sic] fees; but I have determined to keep my fees as low as I possibly can, so that all classes of the community can come to me, and they will know that I shall deal fairly and honourably with them.

I have a thorough practical knowledge of my profession, including (as it does) architecture, surveying, road and sewer construction, development and laying out of building estates, valuing all kinds of property for mortgages or other purposes, putting plans on deeds, reporting on existing or proposed buildings, works, &c., and all other professional undertakings.

But in order that the public—which is generally a careful judge—may know that I am qualified, I may state that I have been examined by the Royal Incorporated Institute of Surveyors (London), and I was found to be thoroughly qualified; and I also hold a Certificate for proficiency in Architecture, issued by the Institute of Architects and Surveyors (London).

Mr. James Craik, surveyor, &c., of this city, has kindly permitted me to state that I was introduced to him in 1890, and that when he endorsed my deeds of articles, he said I was quite qualified in my profession. Several other Bristol architects and surveyors have also recommended me and my work.

In addition to this I append three testimonials of work done by me which, I think, will speak for themselves.—I remain, dear Sir, yours faithfully,

T. JAMES COUNCELL.

## Intercommunication.

## QUESTIONS.

[12245.]—**Gloucestershire.**—I purpose visiting, for my holidays, for a fortnight, at the end of June, the above county, making Gloucester my headquarters. Is there much 16th-century Domestic work in the neighbourhood? Names and particulars of any interesting places for general architectural sketching of easy access will be welcome, and the name of a good guide-book (archaeological) to the county.—NEWCASTLE-ON-TYNE.

[12246.]—**The Soot Nuisance.**—Two flues in a new flat in town give great trouble owing to soot falling and dirtying carpets. Could any reader give a reliable remedy, such as an anti-down-draught owl or other means? The writer had nothing to do with the erection of the buildings, but has no reason to suppose the work has been badly done in any way, and the fires do not smoke in the least.—PERPLEXED.

## REPLIES.

[12239.]—**Pitches and Roofs.**—"Excalibur's" question is almost a satire on the average textbook of construction. He asks, Why are the pitches of roofs shown so flat in textbooks, like that of Newland's "Carpenter's and Joiner's Assistant," and other handbooks? Why, indeed! The answer seems to be simply because such handbooks borrow so much from one another. There is scarcely one building textbook I know (English, I mean) that is not a compilation. Newland's useful work is too much based on Nicholson, Tredgold, and the earlier authorities, who wrote their admirable treatises when flat-roofed buildings, or the Classic Pseudo-Greek style was in vogue, hence their examples of roofs are all flat-pitched, such as one-fourth or one-fifth. More recent writers, like Newland and several new editions based on Tredgold, have adopted the same examples, and have neglected entirely the higher pitches of Gothic and Renaissance roofs. What is quite as misleading, the newer manuals give few, if any, examples of high-pitched or Gothic roofs; the old "King" and "Queen" post truss are repeated. The French handbooks are better. If we take the examples in Viollet le Duc, or in other recent treatises on construction, we find many good examples of Mediaeval or Renaissance timber roofs. The advice of many of the modern textbook writers is not often supported by the best examples, and "Excalibur's" remarks that in both Newland's and Mitchell's excellent works, the authors recommend one-third pitch and illustrate flatter pitches. These things are misleading to students; they are attributable chiefly to good theory supported by bad examples. Textbooks reflect our modes of instruction. The illustrations given are often extremely poor, and in this matter our neighbours are much in advance.—G. H. G.

[12242.]—**Reservation of the Communion.**—Tabernacles that can be, and probably are, used are made with many altars for Anglican churches; mostly of oak, but oftentimes lined with metal, and with a wrought-brass door. As a matter of absolute fact, I have made more of these for the Episcopal Church of Scotland than for that of England. The Holy Sacrament in the Established Church, when reserved in both kinds, is generally so applied with the object of giving Communion to the sick. As soon as the service in church is ended, the reserved Sacrament is taken direct to their bedside. Where tabernacles exist, the Sacrament may be locked up until a convenient time occurs to take it to the homes of the sick—some later hour of the day than that of the service, but on the same day. Often we made "dummy" tabernacles. These stand in their proper place in the midst of the retable or super-altar, and have a front panel, which is really a sham door. At the same time, they are so constructed that at any future season, if deemed desirable, the front panel may readily, by means of hinges and a lock, be made into the real door of an actual repository, in which the Blessed Sacrament is reserved when necessary.—HARRY HEMS.

[12243.]—**Casements.**—Wood casements can be made watertight if proper provision is made by means of check mouldings along the bottom rail or water-bar, and the meeting and hanging stiles are furnished with joints with tongues in the frame, which effectually check the entrance of water. I prefer hanging the casements to open outwards; they are safer. Some useful sections will be found in "Model Specifications," given in the BUILDING NEWS. Metal casements are more likely to exclude driving rains, especially when the casement opens inwards. Messrs. Burt and Potts, Westminster, and the Crittall Manufacturing Company, Braintree, make very excellent metal casements. The metal casements can be screwed to the wood mullions and frame. With outward-opening casements a weather-bar or board should be fixed over the sill, forming a drip, which prevents the water entering.—ARCHITECT.

[12244.]—**Outlet of Closet.**—Too often the short arm or outlet which goes through the wall is connected to a common 4in. cast-iron R.W. pipe, and the joint is made in red-lead in the wall. The L.C.C. regulations, I believe, require the iron soil-pipe to weigh 5lb. to the length of 6ft., and to be 3in. thick at least. There should be a caulked lead joint between outlet and iron soil-pipe. The connection should be outside the house.—A. M.

[12246.]—**Rates of Insurance for Fireproof Buildings.**—By the adoption of improved fire-resisting floors and ceilings, will the fire offices make any reduction in the premiums for insurance, and if so, what? An answer will oblige.—T.

## Our Office Table.

"THE Act seemed to have been drawn by a person who had strayed into the land of topsyturvydom, and there acted upon his recollection of the great composition, 'the House that Jack built,' but also with the disadvantage of not knowing what he meant." This judicial *obiter dictum* regarding the Workmen's Compensation Act, which Mr. Chamberlain a few days ago seemed to claim as a masterpiece of constructive legislation, was delivered in the City of London County-court on Friday by Deputy-Judge Pitt Lewis, Q.C., who dismissed an action for compensation brought by an employé against the owners of the London and India Docks, on the ground that the warehouse where the man was working at the time he sustained his injuries was not a warehouse within the meaning of the Workmen's Compensation Act. This "extraordinary tangle of legislation," as Mr. Pitt Lewis termed it, has been drafted with a total disregard of the plain meaning of the English language, with the result that nearly every day injured workmen, although in the included trades, are debarred from any benefit under the new law.

THE Plans Committee of the Leeds Corporation are determined to put an end to "jerry"-building in the city so far as inferior mortar is concerned. At their last meeting they passed a resolution requiring all mortar used for building purposes to be of a minimum quality of one part of lime to two parts of good engine ashes or clean river sand. This decision on the part of the committee is the outcome of a report by Mr. Fairley (the City Analyst), which document showed that numerous samples of mortar recently analysed by him had been very inferior stuff indeed. In future, whenever one of the building inspectors finds mortar being used by contractors which is of a doubtful strength, he will submit a sample to Mr. Fairley.

In a lecture on the Scenery of the Greek Stage given before the Hellenic Society last week, Professor Percy Gardner urged that there was at all periods in the Greek theatre a raised stage, and proceeded to consider what kind of a background it had. He accepted the tradition that the first painted background was that made for *Æschylus* by *Agatharchus*, of Athens, but maintained that this background was not a canvas scene, but a wooden erection painted to resemble the front of a temple or palace. This scene, like the other stage arrangements due to *Æschylus*, became stereotyped, and was not altered according to the requirements of particular plays. Those requirements were met, partly by the use of periacti, three-sided prisms which turned on a pivot and presented to the audience different paintings which conventionally represented different localities, partly by the use of stage properties, curtains, and the like. But in all periods stage scenery was very simple and not realistic. These views were enforced by an examination of the statements of *Vitruvius* and *Julius Pollux*, and in particular by setting forth the testimony offered by inscriptions from Delos, which prove that the painting of the front of the stage building was permanent, and paid for, not out of the cost of producing plays, but out of the cost of construction.

THE Rev. S. Gillson, rector of Itchen Abbas, Acresford, has raised a discussion in the *Standard* on the age and size of yew trees by asking if any correspondent can name a yew of larger size than the one in his churchyard, which measures at 2ft. 6in. from the ground a girth of 27ft. 7in., with a spread from the extreme ends of opposite branches of 66ft. Mr. Henry Spring, of Woodford, Essex, replies that the one in that churchyard is 15ft. in girth at 2ft. 6in. from the ground and 18ft. girth at 5ft., while in 1816, when Woodford Church was rebuilt, the spread of the branches was said to have been 180ft. Another correspondent, dating from Southampton, gives the following list of big old yews: *Basildon*, Berks, two planted 1726, in 1889 (163 years) one was 9ft. 2½in., the other 9ft. 6in.; *East Woodhay*, Bishop Ken's, planted 1660 (219 years old in 1888), 7ft. 7in.; *Aldworth*, known to be 1,000 years old, 27ft. cir.; *Selborne*, 25ft. 2in. at 4½ft. from ground; *Lockerby*, 23ft. 4in.; *Hurstborne Priors*, 23ft. 10in.; *Darley Dale*, Derbyshire, 32ft., foliage 80 yards in cir., supposed 2,000 years (!); *Corhampton*, a beauty, 22ft.; *Breamore*, near Fordingbridge, 23ft. 4in.; *Brockenhurst*, 17ft., supposed 700 years; *Portingal*,

*Perth*, 56ft. (now very little left); *Itchen Abbas*, 27ft. 6in.; *Dovebridge*, Derbyshire, 22ft., spread 212ft. diameter; *Tisbury*, Wilts, 37ft.

MR. WILLIAM BRADBROOKE, of Bletchley, writes: "The yew at Selborne, which Gilbert White describes as 25ft. in girth, was found in September, 1897, to measure 25ft. 8in., 4ft. from ground, with a spread 180ft. diameter, and a height of 60ft. In Steep churchyard, Hants, are two yews, one 12ft. in girth, and the other 19ft. 7½in., with branches shading a circle about 50 yards round. The well-known Ifley yew is very difficult to measure, as the trunk has numerous young offshoots; it is about 18ft. to 20ft. round. At Alvechurch, Worcestershire, the yew in the churchyard girthed 23ft. 4in. at 4ft. Broughton Hacket, Worcester, has a yew with a girth of 15ft. 3in.; the branches cover a circle of 108ft. round, and is held together with a chain (1892). In Weethly churchyard, Warwickshire, is a yew 17ft. round, and shading a circle about 150ft. in circumference." Mr. C. B. Sparrow calls attention to the Church Preen yew-tree which measured in August, 1897: Umbrage, 230ft.; girth at ground, 37ft. 2in.; 1ft. from ground, 32ft. 7in.; 7ft. from ground, 23ft. 3in.

## MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Architectural Association. Visit to Cobham Hall, Kent. Train for Sole-street from Victoria 11.45 a.m., or Holborn Viaduct 11.40 a.m.  
St. Paul's Ecclesiastical Society. Visit to Blackmore Church, where a paper by F. Chancellor, F.R.I.B.A., will be read. Train from Liverpool-street for Ingatstone. 2 p.m.  
Northern Architectural Association. Excursion to Chester-le-Street and Lumley.  
Edinburgh Architectural Association. Excursion to Arbroath Abbey. Train from Waverley Station. 9.35 a.m.

THURSDAY.—Royal Architectural Museum, Tufton-street, Westminster. Annual Meeting. Address by Sir Wyke Bayliss on "The Bogie in the Studio." 4 p.m.

## Trade News.

### WAGES MOVEMENTS.

NEWPORT, MON.—In reply to an inquiry made by the secretary of the Newport Building Trades' Federation, the secretary of the Newport Master Builders' Association states that the latter are offering employment at the following wages:—8d. per hour till Dec. 1, 1899, when the figure will be 8½d. per hour, and there will be a new code of rules. Labourers to receive 5½d. on the same date. The bricklayers alone have accepted these terms.

SCARBOROUGH.—The Master Builders' Association on Saturday decided to lock out 25 per cent. of the Union men in each branch of the building trade.

NORWICH.—The dispute with the builders' labourers has been settled, the men having accepted the offer of the masters to pay 5½d. per hour, as from June 1.

### CHIPS.

The Thornbury Board of Guardians have adopted plans by Mr. Oatley, of Bristol, for a new work-house infirmary.

Mr. Harry Martin, of Acock's Green, Birmingham, has been appointed building inspector to the Stoke-on-Trent town council from among 41 candidates.

The Constitutional Club in Weaver-street, Winsford, was formally opened on Wednesday week. It has been built, at a cost of £1,600, from plans by the late Mr. Waring. The contractors were Messrs. A. and H. Halse, of Winsford.

Alterations are being made to the Board School, Merthyr Tydfil, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

The rebuilding of the premises of the Surveyors' Institution in Great George-street being now complete, the offices of the Tribunal of Appeal have been removed from the temporary premises in Savoy Hill to the new premises of the Surveyors' Institution.

The proposed legislation to limit the height of all buildings within 1,000ft. of the Boston State-house to the level of the main cornice of that venerated structure is likely to fail, the Committee on Cities having reported the petition for such legislation unfavourably; but a substitute Bill has been reported, limiting the height of all buildings within the State of Massachusetts to 100ft. This latter measure has since been rejected.

Whitworth—Portable Galvanised Iron Ashbins	Urban District Council	T. Biker, Surveyor, Whitworth, Lancs.	June 5
Exeter—Cast-Iron Pipes (1,700 tons)	Corporation	Donald Cameron, City Surveyor, 18, Bedford-circus, Exeter	5
Christiania—Raw Iron, &c.		The Commercial Dept. of the Foreign Office, Whitehall, S.W.	5
London, W.—Steel Girders, &c. (715 tons)	Great Western Railway Co.	The Engineer's Office, Paddington Station, London, W.	6
Trichinopoly, India—Pipes, Specials, and Fittings for Water-works Extension		Henry S. King and Co., 65, Cornhill, London	7
Crawley—Cast-Iron Spigot and Socket Pipes (280 tons)	Crawley & District Waterworks Co.	C. O. Blaber, M.I.C.E., 64, Ship-street, Brighton	7
Battersea Park-road, S.W.—Steel Joists for Baths	Vestry of St. Mary	W. Wilkins, Clerk, Municipal Buildings, Lavender-hill, S.W.	9
London, S.W.—Galv. Eye Bolts and Strand Wire for Fencing	Southern Mahratta Railway Co.	E. Z. Thornton, Sec., 46, Queen Anne's-gate, Westminster, S.W.	13
Huret—Cast-Iron Pulleys, Manhole Covers, Step-irons, &c.	Urban District Council	E. Garside, Engineer, Town Hall Chambers, Ashton-under-Lyne	14
Winsford—Cast-Iron Water-Mains (25 tons)	Urban District Council	H. Hulce, County Surveyor, Market-place, Winsford	15
Matlock—Steel Trappers for Cable Tramway (One Year)	Urban District Council	Albert M. Clarke, Surveyor, Town Hall, Matlock	17
Wadebridge—Cast-Iron Pipes (350 tons of 6in., 4in., and 3in.)	Urban District Council	Geo. H. Harris, Engineer, Wadebridge	

## STORES.

Levenshulme—Limestone Chippings, Artificial Flags, &c. (1 Yr.)	Urban District Council	James Jepson, District Surveyor, 8A, Tiviot Dale, Stockport	June 3
Cockermouth—Sewer Pipes (12in. and 6in.)	Urban District Council	The Surveyor, Council Offices, Cockermouth	3
Leeds—Granite, Limestone, Flags, Bricks, &c.	Rural District Council	H. H. Hodgson, Surveyor, 46, Frankland-place, Leeds	3
Beccles—Broken Granite (650 tons)		The Town Clerk's Office, Beccles	5
York—Permanent-Way Materials (Six Months)	North-Eastern Railway Co.	John Snowden, Central Station, Newcastle-on-Tyne	5
Montrose—Granite (Nine Months)	Rural District Council	J. J. Fairfax Scott, Clerk, Union Offices, Montrose, Leicester	5
Hythe—Kerb and Broken Stone (Nine Months)	Roads and Bridges Committee	Arthur S. Butterworth, A.M.I.C.E., Borough Surveyor, Hythe	5
Pershore—Stone for Repair of Highways (One Year)	Rural District Council	Arthur E. Baker, Clerk, Pershore, Worcestershire	6
Genoa—Firebricks	Urban District Council	The Commercial Dept. of the Foreign Office, Whitehall, S.W.	6
Branksome—Granite (275 tons)		J. Newman, Surveyor, 3, Tennyson Bldgs., Ashley-rd., Branksome	6
Halifax—Oils, Paints, Wrought-Iron Tubes, Cast-Iron Pipes, &c. (One Year)	Gasworks Committee	Thos. Holgate, Engineer, Gasworks, Halifax	7
Enfield—Granite (4,700 tons)	Urban District Council	Richard Collins, Surveyor, Court House, Enfield	7
Brighton—Portland Cement (One Year)	Town Council	F. J. C. May, M.I.C.E., Boro' Engineer, Town Hall, Brighton	9
Ely—Granite (1,215 tons)	Urban District Council	Wm. McKelvie, City Surveyor, Ely	10
Wolverhampton—Granite Kerbing (3,000ft.)	Streets Committee	J. W. Bradley, Borough Engineer, Town Hall, Wolverhampton	19
Wolverhampton—Granite Setts (5,700 tons)	Streets Committee	J. W. Bradley, Borough Engineer, Town Hall, Wolverhampton	30

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2318.

FRIDAY, JUNE 9, 1899.

## SPECIALISED PLANNING.

AS the athlete only by a rigid physical training and by mastering a number of apparently impossible positions is able to achieve success, so the architect can only successfully combat the difficulties of plan by repeatedly attacking the problems which encounter his path. There are vital questions of official requirements, departmental routine, hygiene, which interfere with the planning of certain buildings, that do not conflict with other branches of the designer's work. It is on this ground the architect has to struggle the hardest if he wishes to become an expert, or to reach a position of success. He may be ever so good as a designer in a particular phase of style, or as an expert artist and draughtsman; unless he can show he has made himself acquainted with the absolute requirements, official or otherwise, of the building he has in hand, he can never attain success in any particular class of construction. We are not now speaking of the general practitioner's work, but of the designers of our best schools, baths and washhouses, and technical institutes—men who have achieved their reputation by dint of hard work in mastering the details of plan, of Blue-books, of medical expert evidence, the requirements of the Education Department, and the Local Government Board.

The useful and suggestive paper read on "The Planning and Construction of Board Schools," by Mr. T. J. Bailey, F.R.I.B.A., at the Institute the other day, and reported in our last issue, exceedingly well illustrates the subject of these remarks. The architect to the School Board for London may be regarded as a specialist of a very important class of building. His large experience of the varied requirements of employers, of the numerous systems that successive School Boards have adopted, and his practical knowledge of the results of these systems entitle his remarks to the most attentive consideration. In other departments of official architecture, we have had acknowledged leaders of bath and washhouse design, public libraries, giving us also their acquired personal practical experience of each of these branches of arrangement. In each case we find there have been several problems to solve, old conventions to be laid aside as wrong or out of date, old prejudices of employers and committees to overcome. The requirements of large and growing populations have suggested modified arrangements often simpler than the old ones, provision for holding large assemblies, or modes of arranging entrances and exits to suit individuals or large groups of people. To take the London School Board planning, we find the requirements more complex and varied than in many other buildings. There is the question of site; it should, as Mr. Bailey said, have a western street frontage; it should be large enough to secure immunity from noise of traffic, and give ample light and air, playground room of at least 30ft. superficial for each child, and to be of a shape to suit football and other games. The absorption of valuable sites for these schools in London is often a matter for regret, but space has to be provided in the centre of crowded districts. The school raised on arches or vaults to allow of a covered space beneath, for the younger pupils, with a roof flat paved with asphalt over the whole building for the girls, are details of planning which were unheard of by our

predecessors. Then there was the equally important matter of the plan of the schools. After many years of experimental school building, the London School Board adopted the centre hall, with its grouping of classrooms, as the type that gave the best results, and upon this plan most of the London schools are arranged. The author of the paper described the "three-story school" building as that most adopted, in which the ground story is occupied by the infants, the first story by the girls, and the top story by the boys. This arrangement is found to work best; also, that the maximum size of a group should not exceed 1,548—i.e., in three departments of 516 each, further accommodation being provided by a separate mixed department. The size of the hall is 54ft. by 30ft.; each department has ten classrooms, accommodating from 60 to 40, and these are better placed facing the playgrounds behind the hall, and having an east light. The hall serves as a reservoir of air on the west side, and makes a better feature in the elevation to the street, as its series of windows, and the external treatment of the staircases and cloak-room, &c., can be made to present a good front, varied in treatment and skyline. We do not say many of the schools erected in London and suburbs are good examples of design; in some cases of new schools, like those in Lyham-road, Brixton, at Kennington, at Clapham, and other suburbs, these divisions of the plan have not been made the best of; there is also an attempt to introduce ornamental turrets or cupolas of a somewhat flimsy or pretentious kind on some of these schools. In others the roof-planning or the grouping of hall, staircases, or classrooms is not satisfactory, and the roofs came together awkwardly instead of being made to lend a picturesque outline to the buildings. But we rather dwell now on the more perfect development of plan. For a number of years the building of these schools was experimental; foreign types were adopted without being suited to the site or surroundings; but the schools put up to-day are perhaps as perfect as it is possible, under the circumstances, to make them. Many experts have spent years over the problem; there has been an enormous expenditure of money; many buildings have been overhauled in the past, but there is at length some hope of success. A few questions of importance have yet to be determined, and first that of warming and ventilation, which has been discussed for 20 years. Mr. Bailey approved of the low pressure, hot-water system, with pipes round the walls above the floors, where the desks are placed, supplemented by a few ventilating radiators admitting fresh, warm air. He has tried trunks opening from the ceiling levels, gathered into one single outlet, with a coil of hot pipes to produce an upcast, but without success for schools of more than one story, as they conveyed sound; and he recommends the "Plenum" system, which admits fresh filtered air above the breathing level, extracted at the floor level on the same side as the inlet. The question is an open one as to whether purity of air can be secured by drawing off the vitiated air at the floor level, or whether the plenum system is desirable in warm weather, with cold air forced in. Another question is the distance of side light from the pupil. Classrooms are often made 22ft. or more in width, so that the scholar is placed that distance from the light. The earlier schools had large classrooms for 80 scholars; but the smaller ones are found better and easier for working, and 50 is considered a more reasonable number; then there was the question of flooring, whether they should be graded or not. A further point is the acoustical properties of the rooms. The experience learned by those who have gone through the ordeal of school planning

is that the earlier plans were utterly wrong in principle, and the London School Board buildings, although costly and experimental, have done much to teach the right principles. There is a great deal yet to learn about other kinds of building which have a briefer history, such as technical schools and institutes. These are still passing through their experimental stage, and there may be yet much still to unlearn before we discover the real and economic solution of the problems they present.

## ESTIMATES.—IX.

### MASONS' WORK.

FROM calculations based on the cube stone and labour of certain kinds of work, such as window-sills, mullions, string-courses, and cornices, the student will soon be able to compare the prices or amount of stone and labour in them. Thus he will see that a chamfered sill 12in. by 12in. and 1ft. in length, containing 1c.ft. of stone, will cost less in proportion than 3ft. run of stone mullion, also containing a foot cube chamfered at each corner, 6in. by 8in., because the labours in the latter are greater. But if we take them both by the foot run, the sill will price out more, because it contains a cube foot of stone as against 4in., or a third of a foot cube, in the mullion. In short, the quantity of stone in a large scantling will cost more per foot run than a smaller scantling with more labour in it, except when there is circular or moulded work, as in a richly-moulded mullion or jamb. The quantity of stone and the quantity of labour both affect the cost of the work, and hence in judging the price of any item the proportion of the latter to the former must always be considered. A good rule is to compare the sectional area in inches of the scantling, as we have before said. Sections of the same area, and having similar labours, like a chamfered mullion or a weathered sill, will be about the same in price.

The prices of the following items or elements of a foot cube of Portland stone may admit of variation according to local circumstances.

	£	s.	d.
Portland stone, 20ft., average at depôt	0	2	8
Including waste and delivery within four miles of depôt	0	3	6
Hoisting and setting	0	0	6½
Cleaning down	0	0	4½
Mortar	0	0	0½
1½ft. beds and joints at 5d.	0	0	7½
	0	5	1½

As priced in 1891, the foregoing items gave a total of 3s. 8d. per foot cube, the stone at depôt being priced at 1s. 10d. For ordinary work materials and labour as in sills, quoins, jambs, or Portland is often priced at 7s. 6d. to 8s. 9d. per foot cube.

Referring to our remark last week that the builder often underlets; the stonework of a building contract to a local mason or stone merchant, a well-known firm of stone merchants state, correctly, "a very large proportion of the stone trade is done through merchants, and several large quarry owners look to merchants only for their trade." We are anxious to be able to correct any wrong impression that any readers may have gained from our observations, and we gladly admit that a large part of the stone trade is done through the merchant; what we intended by our remark was simply that the ordinary building contractor is not always competent to undertake the stonework, and that it is better for him to let the work to a firm of stone merchants. All large quarry owners and merchants have offices in London, who are prepared to furnish price for any quantity of stonework, including delivery on the works; they have, therefore, the advantage over the ordinary contractor.

The merchant or quarry owner is also able

to make better terms with the railway company than the builder. These considerations ought to be taken into account before pricing items of stonework on any large transaction.

We now give a few items of Portland stone which can only be correctly priced by roughly taking out the quantities of stone and labour. The prices we append are, in some cases, rather high for large quantities, and therefore they can only be taken as approximate valuations.

6ft. 6in. run. 11in. by 3½in. sill as before, but in one length.

Put this sill at 4d. more than the previous one, 10in. by 4in. (page 736); say, 3s. 6d. There is more risk to large stones.

No. 12. Fair ends, stopped to weathering of sill.

These ends are rubbed, and form hollow stops to weathering. These are worth about 1s. each end.

18ft. run. 6in. by 8in. mullions, splayed according to detail.

To price this correctly it is necessary to take out the quantities. Let us say there are three mullions, 6ft. long each.

3 6 0	6 0	Cube scantling, including waste, hoisting, and setting, at, say, 3s. 6d.	£ s. d.
8			1 1 0
6 0 8	2 0	Bed at 5d.	0 0 10
3 2 4	42 0	Plain face at 8d.	1 8 0
6 0	24 0	Sunk face at 1s.	1 4 0
12 4		Slate dowels, mortices, and cement	0 6 0
6 0			3 19 10

This would be equal to 4s. 8d. per foot run. According to the scantling and length of each mullion, 6ft. long by 8in. by 6in., there is just 2ft. cube in each mullion, or 1ft. cube in 3ft. run; equivalent to 13s. 2d. per foot cube.

18ft. run. 12in. by 6in. stone head to two windows.

This would equal about 6in. cube stone per foot, and would cost, including waste and setting, at 3s. 6d., say	£ s. d.
0 1 9	
Add 3ft. super. half sawing on four sides	0 0 10
1ft. 6in. plain face, rubbed extra, say	0 0 6
Sunk face, 4in. wide, 3ft., say	0 0 4
Eight stopped ends, 6d. each per foot	0 0 3
	0 3 10

Or, say, 7s. 8d. per foot cube.

We have supposed the head to be in one stone, more probably it would be in two stones.

50ft. run. Portland stone moulded plinth, 2ft. 6in. high, and average depth 1ft. 6in., joints, averaging 3ft. apart.

To price this, take out quantities for a 3ft. length.

3 0	Cube stone, including waste, hoisting, and setting, at, say, 3s. 6d.	£ s. d.
2 6		1 19 0
1 6	4 6	Bed at 5d. (average bed) ... 0 1 10½
3 0	3 9	Joint at 5d., say ... 0 1 8
1 6	7 6	Half-joint back at 2½d. ... 0 1 6½
2 6	7 6	Plain face at 8d. ... 0 5 0
3 0	6 1 6	Moulded work, 6in. girt, at 2s. 6d. ... 0 3 9
2 6		3ft. run rough sunk face, 6in. wide, at 10d. ... 0 2 6
3 0		Cost of 3ft. ... 2 15 4½

Equal to about 18s. per foot run, or, say, 6s. per foot cube.

60ft. run. Portland stone quoins in courses averaging 1ft. 1in., and 10in. on face alternately, and 12in. in depth.

The quoin stones by this description vary

in face and depth on alternate sides. To take four courses (as sketch), obtain average of width and depth. The quantities for four stones would be

3 9	Cube Portland stone in four	£ s. d.
1 1	quoins, at say, 3s. 6d.	0 12 2
0 10	Hoisting, setting, and cleaning down 8d.	0 2 7
4 1 1		
0 10	3 8	Bed at 10d. ... 0 3 0
1 11		
3 9	Half joint and plain face to face and back 10½d.	0 6 1
7 0		1 3 10

works out at about 5s. 3d. a foot run.

40ft. run. Portland stone cornice, 2ft. 6in. on bed, 9in. deep, and in stones averaging 3ft. in length, joggled together, run with cement.

Take two stones or a 6ft. length.

6 0	Cube Portland in two stones,	£ s. d.
2 6	hoisting and setting, at	
0 9	4s. 3d.	2 7 9
6 0		
2 6	15 0	Bed at 10d. ... 0 12 6
2 2 6		
0 9	3 9	Joint at 5d. ... 0 1 6
6 0		
1 6	9 0	Sunk bed underside 1s. ... 0 9 0
6 0		
0 8	4 0	Plain face back 8d. ... 0 2 8
6 0		
1 2	7 0	Sunk face to weathering 1s. ... 0 7 0
6 0		
1 10	11 0	Moulded face 2s. ... 1 2 0
3 2 0		
6 0	6 0	Joggle and cement 1s. 3d. ... 0 7 6
		5 9 11

Equal to about 18s. per foot run, or say 9s. per foot cube.

This price is rather low for a small quantity, and may be taken at 12s. per foot cube in some cases.

40ft. run. 12in. by 6in. moulded string (see sketch), 10in. girt, weathered on top in stones 9in. and 4in. on bed alternately.

Here we take the cube stone and labours as before.

3 0	Cube stone, hoisting and	£ s. d.
1 0	setting, 3s. 6d.	0 5 3
0 6		

Taking two beds 12in. each, and joint 6, we have:—

3 0	7 6	Half-bed and joint, 5d.	0 3 1
2 6			
3 0		Sunk face for weathering,	
0 6	1 6	10d.	0 1 3
1 0			
0 6	0 6	Joint, 5d.	0 0 2½
3 0			
0 10	2 6	Moulded face, 2s. 3d.	0 5 7
		Joggle and cement, 1s.	0 0 1
		Cost of 3ft.	0 15 5½

Equal to say 5s. per foot run, or 10s. per foot cube.

#### ST. SIDWELL'S, EXETER.

REFERRING to the notes in the BUILDING NEWS for May 26 upon the late spire and ancient 15th-century weathercock appertaining to this church the following may be deemed a continuation. The wrought-iron vane (see accompanying sketch) undoubtedly dates from the same time as the bird itself (A.D. 1484). It crowned the apex, successively, of both the cathedral and St. Sidwell's spires—seen to the eye its full length, save the lower four feet (below the projecting amulet). This bottom part was let into the solid woodwork forming the capping to the upper portion of the framing of the spire. One of the horizontal ends is missing, all save a fragment of its necking. It represented a Tudor rose, and seemed to have practically rusted off; of the other, a larger illustration than the actual sketch allows is given through the friendly medium of my son, H. Turner Hems's, camera. Why one terminal should have corroded so fatally, whilst the rest of the vane bears no suggestion whatever of oxidation, is as inexplicable a problem as is at present the query how the steamship *Paris* came to get on to the Manacles when it had so wide a waterway to steer through ere reaching the Atlantic. Save where shown as gilded, no signs of paint exist upon the metal-work.

Here is a photo-litho. of one of the nave arcade capitals. Each is 1ft. 10in. square by 11½in. deep of actual carving; there are eight of them and four responds. They are all carved upon the same motif. The patron saint is represented forty times, facing four ways on each full capital, but in only one capital with her head off and in her left hand (the view herewith shown). Every figure, however, has the scythe in the same position; these scythes have shorter blades than are those in use nowadays. Exactly the same shaped implements, held by a triplet of mowers, may be seen upon one of the thirty-seven 15th-century carved oak misericordes in the choir of Worcester Cathedral. Of course, St. Sidwell is by no means the only virgin saint and martyr who carries her own head in her hand. According to examples left us by ancient sculptors and illuminators, SS. Winifred, Valeria, Flora, Regula, Grata, and Adelaide were addicted to the same practice, and so was St. Osyth, the 2nd-century Queen-Abbess, who, it will be remembered, is thus represented upon the ancient seal of her church at Chick. Further, there are at least half a dozen saints of the sterner sex, besides the namesake of our own proto-martyr St. Alban (A.D. 303), who did the same thing. The St. Alban in question was a 7th-century German bishop, and he is represented with his own head in his hands in several churches in Cologne and Metz. The others are SS. Clarus, Cheron, Lucanus, Dionysius, Mitrius, Proculus, Piat, Denis, and Nicasius.

Note the winged arms and plate-armour treatment of the angle shield-bearing angels. They seem to represent respectively archangels and virtues. There are other instances in the county of 15th-century angel capitals treated much as are those of St. Sidwell's, and, like the latter, without abaci.

As stated in my last, the arcades—arches and piers alike—are of Beer stone. Beer is the most romantically-situated fishing village on the whole South Devon coast. The hamlet is in the bosom of a deepcombe that dips away from the heights, down between the cliffs to the very edge of the ever-restless water of the English Channel. Beer is about 19 miles, as the seagull flies, from the sturdy Norman towers of Exon's cathedral church. In the rearing of these towers, and of the rest of the cathedral later on, Beer stone was largely used. According to the Chapter Rolls, hundreds of years after the erection of

VANE, ST. SIDWELL'S, EXETER.

the towers, Bishop Stapeldon (A.D. 1325-30) procured stone from the Beer quarries for building the Choir and Lady-chapel. These quarries have been worked from the remotest period, and to 18ft. deep, and is in four distinct beds. In the old workings the pick marks of the Norman quarrymen, made by them when raising stone for the first Norman cathedral, are as fresh as

ST. SIDWELL'S, EXETER.—ONE OF THE NAVE CAPITALS (Fifteenth Century).

are still in use, the supply being quite inexhaustible. The old workings are tunnelled and flat; but, in the still earlier excavations, if only chiselled yesterday. These 11th-century workings have their roofs finished quite level

the tops are left round-headed. The ancient quarrymen seem to have used much the same kind of picks as are now in vogue; but indications go far to suggest that in Mediæval times the blocks quarried were not nearly so large as are

ST. SIDWELL'S, EXETER.—TERMINAL OF CROSS OF FIFTEENTH-CENTURY VANE.

those nowadays. Blocks may now be procured of any size up to 120 cube foot (16ft. to a ton).

The rood and parclose screens at St. Mary's Church, Totnes, in this county, the finest stone screens in Devonshire, and perhaps (as 15th-century work) in any parish church in England, are of this stone. They were made in Henry VI.'s time (erected A.D. 1459-60). Stone screens are not common in Devon, but examples of more or less interest may still be seen in the parish churches of Awliscombe, Bideford, Colyton,

Culmstock, Hemyock, Ottery, and Paignton. They are all of Beer stone, and appertain to the Perpendicular period.

In a former article it was mentioned that Sir Walter Raleigh's father was imprisoned in St. Sidwell's western tower. An old historian records the circumstances connected with this arrest—

he environments suggesting that our church has had more than one "crisis" before to-day! This is what the writer in question says:—

"One day (July, 1549) a gentleman named Walter Raleigh, overtaking an old woman, going to St. Mary's Church to mass (a village four miles from Exeter, and situated between Sir Walter's residence and the city), remonstrated with her, and endeavoured to dissuade her from her purpose, but without effecting his end. The woman went to the church, and loudly misrepresented his conversation, by saying he had threatened that they should be burnt out of their dwellings unless they gave over holy bread and holy water. This enraged the inhabitants. . . . So some of their party, having overtaken Mr. Raleigh, greatly misused him, and threatened to murder him, so that he was obliged to take shelter in Topsham Church, from whence he was rescued by some mariners of Exmouth. Yet though he escaped this time, he afterwards fell into the hands of the rebels, and was imprisoned in the tower of St. Sidwell's church, until the commotions were ended. The tower being much injured by the rebels, was soon afterwards nearly rebuilt."

Exeter.

HARRY HEMS.

#### THE CANTILEVER BRIDGE: ITS DESIGN AND CONSTRUCTION.—IX.

IT is to a great extent immaterial, as has been already stated, in analysing the stresses upon the different parts or spans composing a cantilever bridge, whether we commence with the anchor arm, the cantilever arm, or with the central independent trussed girder. There is, nevertheless, some advantage gained by beginning the computation of the stresses with the determination of those to which the central girder is subjected. It is true that this advantage does not become particularly apparent until the calculation of the stresses upon the cantilever arm comes into question. But then, as will be subsequently pointed out, it will be found that the *a priori* knowledge of the loads and stresses transferred to the cantilever arm by the central truss very much facilitates the whole of the future mathematical and arithmetical operations required. An elevation of the central girder of the design we have selected for calculation is given in Fig. 1, and the manner of lettering the diagram and the reasons for so doing must be first explained. The single letters do not represent by themselves any members of the truss, but apply to the spaces outside the whole elevation of the truss, as well as to the triangular spaces inclosed by the separate members. Thus the whole space outside of the upper boom or chord, and the ends of the girder is lettered A, and the similar space outside the lower chord is marked B. The reason why it is necessary to make a distinction between these spaces will be apparent as we proceed. In addition, each triangular space formed by the attachment of the bracing in the web to the booms or flanges at the successive apices is marked by a letter of its own. The reading of this description of lettering, or the mode by which the individual members of the truss are identified and distinguished from each other is as follows:—Let us take the second panel length from the left-hand end of the truss, the separate members of which consist of a certain part of the upper and lower booms respectively, a pair of vertical and a single diagonal brace.

First, for the upper flange length. The space outside the whole of the upper chord is lettered A, and the triangular space inside immediately underneath the panel length selected is marked *d*, and this length of the upper chord, or of this particular member of the truss, is distinguished by the letters A*d*. Again, the space outside the lower boom is marked B, and the triangular space or area inside is lettered *e*, so that, by parity of reasoning, the lower flange member of the second panel is designated by the letters B*e*. For the vertical member on the left-hand side of the panel length, the triangular spaces on each side of it are marked *c* and *d* respectively, so the vertical is known as *cd*. It will be easy now to distinguish the diagonal bar in the panel as *de*, and the right-hand vertical by the letters *ef*, and so on for any other different members of the whole truss. It is very usual in textbooks on the subject of stresses upon bridge and roof trusses as determined by the elegant method of graphic statics and stress diagrams, to notice that separate letters are assigned to the member composing each panel length of the boom upon which the load is placed. This is quite unnecessary, as will

be subsequently pointed out, and only leads to a superfluous multiplicity of letters which only bewilders the reader, and is as useless as it is confusing.

The system of notation employed in the example in Fig. 1 is that known as Bow's, and was introduced by the late R. H. Bow, a well-known engineer of Edinburgh. In order to thoroughly prove its advantages, especially in connection with the use of the graphic method and of stress diagrams, it will be advisable, before

FIG. 1.

FIG. 2.

proceeding with the determination of the stresses upon our central truss, to apply the principle to a more simple example than that shown in Fig. 1. A skeleton elevation of a small truss of the Warren type is shown in Fig. 2, and loaded uniformly throughout the whole span, although, for the purposes of determining the stresses upon it, the loading is regarded as being divided into three equal parts which are situated respectively one upon each apex of the upper boom. The truss is suitable for a deck bridge, and, as such, the end members of the lower chord, shown in the diagram by the dotted line, are superfluous, or otherwise termed redundant. There is another and more theoretically accurate method of subdividing a load uniformly distributed over the upper flange of the Warren girder in Fig. 2, which may be thus stated. Commencing with the first bay or panel length at the left abutment extending from O to the first weight, it is evident that, with a load uniformly distributed over it, one half will be carried by the left abutment and the other half by the apex where the first weight is placed. Passing on to the second bay, one-half of its load will, under the same conditions, be transferred to the first apex, and the other half to the central apex where the second weight is placed, and the repetition of the process for the other half of the truss will give similar results. Let W equal the value of each of the three weights in tons, or in any other suitable unit; then the total load affecting the stresses on the girder will, under

FIG. 3.

FIG. 4.

the assumption that the total is placed as in Fig. 2, be equal to three times W. The reactions  $R_1$  and  $R_2$  will be given by the equation

$$R_1 = R_2 = \frac{3 \times W}{2} \dots\dots\dots(1)$$

An inspection of the diagram will indicate that the distance 0 — 1, 1 to the first weight, and from that point to 2, and continuing in the same manner to the right abutment at 5, divide the length of the girder into eight equal parts, and the total load also into similar subdivisions. Consequently the part of the total load which is transferred to the two abutments which produces no stress upon any members of the girder is equal to—

$$3 \times W - \frac{9 \times W}{4} = \frac{3 \times W}{4} \dots\dots\dots(2)$$

This result may be reasoned out as follows: Since there are four bays or four panel lengths in the upper chord of the truss, and a total uniformly distributed load of three times W upon it, the uniform load upon each panel length will be equal to  $\frac{3 \times W}{4}$ . Half of this covering the two end panels, and extending from 0 to 1, and from 4 to 5, is directly supported by the abut-

ments, and exerts no stress upon any member of the truss. But this half is equal to  $\frac{3W}{8}$  upon each point of support, so that by doubling this amount, it becomes as before equal to  $\frac{3 \times W}{4}$ .

The important detail to be borne in mind with respect to this comparatively small percentage of saving in the uniform load upon the whole girder, is that it can never exceed altogether the amount of the load upon one panel's length, presuming, as is generally the case, the panels are of the same constant length. But as it sometimes happens that they vary in length, the saving must be computed for each half of the girder or truss, as equal to the load covering or uniformly distributed over each half of the end panels, whether they are equal to each other or not.

The advantage of Bow's notation, when stress diagrams are employed, as they very generally are now for determining the stress upon a certain class of structures, consists in the fact that the same letters used for designating any member of the truss in the skeleton or frame diagram, can be also used for indicating the line in the stress diagram whose length measured by scale will give the stress upon that member. There is no other system of notation which can compare with it in this respect, although many writers on the subject decline to avail themselves of its incontestable merits. The spaces and areas in the elevation of the truss in Fig. 2 are lettered in a similar manner to those in Fig. 1, and therefore require no further explanation. On the line of loads in the other diagram in Fig. 3 for the Warren truss, in Fig. 2, let the distances AA, AB, BA, AA represent in amount the three loads, each equal to W, on the upper flange of the girder, bearing in mind that

AB and BA are each equal to  $\frac{3W}{2}$ , so

that the three weights in the frame diagram are really equal to the distances AA, AA, and AA in the stress diagram. It results from using the space letters A and B of the frame diagram to mark the divisions of the load line in the stress diagram, that we are enabled to dispense with the complicated lettering of every individual member of the upper loaded chord of the truss. Having constructed the stress diagram according to the ordinary rules which have been previously enunciated in our columns, and assigned letters to the line of loads, the next point to be determined is, upon what principle is the rest of the lettering to be arranged, so that the same letters may represent both the members in the frame diagram and the corresponding stresses upon them in the stress diagram. In the first place, it should be mentioned that the stress diagram in this instance—although it is not absolutely necessary in all cases—is a reciprocal diagram. When possible, a reciprocal diagram should always be employed, as it renders the whole process of ascertaining the stresses considerably simpler and clearer. It follows from the reciprocity of the two diagrams that the lines in the one which inclose an area meet at one point in the other, and *vice versa*. This is the most important and very valuable feature in reciprocal diagrams, and one which is of the greatest possible assistance in discriminating between the various directions and characters of the different stresses upon the members of any structure. In conformity with this rule, therefore, let us consider the first bay at the left abutment, where the three members A*c*, B*c*, and *cd* form the closed triangular space *c*. These members must, in the stress diagram in Fig. 3, meet in a common point, which, it is obvious from the conditions of the case must be lettered *c*. On referring to the diagram the point is so lettered, and the stresses upon the three members A*c*, B*c*, and *cd* are given by the length of the lines distinguished by the same letters. For the next panel, since the three members inclose the area *e*, the lines representing the stresses on them in Fig. 3 must also meet at a common point which is marked *e*, and the stresses upon them will be equal to the length of the lines A*e*, *de*, and *ef*. The same process will give the line B*f* in the diagram equal to the stress upon the central bay B*f* of the lower chord of the truss. As the total load is taken up as uniformly distributed over the upper chord, the stresses upon the other half of the girder can be obtained in a similar manner, and will be equal to those already found for the corresponding members of the left-hand half of the truss. It is clear

that half of the stress diagram in Fig. 3 would be sufficient to determine the stresses upon all the members of the truss, but it is usual to plot the diagram for both halves, so as to see whether the two halves will "close" at the point *f*. There is a great deal too much importance laid upon this "closing" of diagrams, as there are several simple methods by which the accuracy of the half-diagram can be checked without reduplicating it in delineation. In fact, when there are a large number of panel lengths, as in trusses of magnitude, a good deal of confusion and inconvenience is apt to attend the plotting of both halves of the stress diagram, as is apparent to a comparatively small extent in Fig. 3. In the diagram it will be seen that some of the same points are marked with two letters, *d, d, f, f*—for instance, in order that the corresponding numbers of each half of the truss may be readily identified. This inconvenience of lettering the same point in the diagram twice may be avoided by plotting the diagram as shown in Fig. 4—that is, upon each side of the line of loading in a horizontal instead of a vertical direction. It is true that in this method the stress diagram will not close; but, as already remarked, that is not by any means a matter of primary importance. It will not be necessary to check all the stresses arrived at in the diagram in Figs. 3 and 4 by an independent method. One or two examples will be quite sufficient, so we will select the members *Ae*, *Bc*, and *ef*. The reaction at either abutment is equal to  $\frac{3 \times W}{2}$ . Let *S* equal

the stress upon the panel-length *Ae*, *S*<sub>1</sub> that upon the bar of the web *Bc*, and *S*<sub>2</sub> for that upon the central bar *ef*. There is a detail in connection with the members or bars of all open-web girders which should be noticed, and that is that certain bars are what are termed pairs, which are subjected to stresses of equal amount, but of opposite character. A reference to the diagrams in Figs. 3 and 4 will show that the stresses upon the bars *Bc* and *cd* fulfil these conditions, and are consequently pairs. The manner in which the load is distributed over the truss will determine which members of the web are pairs and which are not. If in the elevation in Fig. 2 the load be uniformly distributed over the lower flange or chord, the arrangement of the pairs is at once changed. The bars which now become pairs are those lettered *cd*, *d, e, ef*, and *e, f, f*. Were the diagram in Fig. 3 drawn to satisfy the requirements of a uniform load covering the lower chord, this equality of stress would be equally apparent as it is for the other distribution of the load. It should be borne in mind that this rule does not apply to bowstring, polygonal, or any description of girder or truss in which the angle between the different bars of the web and the horizontal or the vertical is not a constant quantity.

Referring to Fig. 1, the value of *S* is—

$$S = R_1 \times \tan. \theta \dots\dots\dots (3)$$

and for that upon the bar of the web *Bc* we obtain—

$$S_1 = R_1 \times \text{cosec. } \theta \dots\dots\dots (4)$$

The stress upon either of the central bars *ef* and *e, f, f* is obtained from the equation—

$$S_2 = W \times \sin \theta \dots\dots\dots (5)$$

Put *W* = 1 ton, or for any other unit of weight, and let  $\theta = 45^\circ$ , then, since  $R_1 = \frac{3 \times W}{2}$ , we have

$$S = 1.5. \quad S_1 = 2.121, \quad S_2 = 0.7071.$$

If, in the diagram in Fig. 3, the distances *A - 1*, *A - B* on the load line be made equal to one ton and one half-ton respectively on any convenient scale, the lengths of the lines *Ae*, *Bc*, and *ef* will give the stresses upon the similarly-lettered members of the truss in Fig. 2 with an amount of accuracy quite sufficient for all practical purposes. If the stresses upon the remaining members be analytically investigated, an equally close agreement will be obtained, as in the case of those already investigated. Having now fully explained and illustrated the mode of procedure to be adopted in calculating the stresses upon the different members of the cantilever bridge, we shall apply it to the example selected, and tabulate the results, so that the structure may be designed, the working drawings made, the specification written, and the steelwork of the bridge ready to be placed in the hands of the contractor for construction and erection.

St. Michael's Church, Shap, has been reopened by Bishop Bardsley after restoration and extension.

#### TEST OF A FIREPROOF SKYSCRAPER.

THE recent fire at the Windsor Hotel on Fifth Avenue, as well as the fire at Rogers, Peet, and Co.'s clothing establishment on Broadway, New York, has brought the subject of fireproof buildings once more in a prominent manner before the general public, as well as the architectural profession. The fire at the Windsor Hotel created a sensation from the rapidity with which the building was totally consumed and the sad loss of life occasioned thereby. The interest, from a fireproofing point of view, however, was slight, as the building had no pretensions to being a fireproof structure.

In the Broadway fire, however, the case is different, and there are several lessons, from a fireproof standpoint, to be learnt. The fire occurred in the block on Broadway between Warren and Murray streets. On the Warren-street corner stood the five-story clothing establishment belonging to Rogers, Peet, and Co. Next to this store was the seventeen-story fireproof building owned by the Home Life Insurance Co., and next to this, and on the corner of Murray-street, stood the Postal Telegraph Co.'s building, a fireproof structure also, of fourteen stories. Therefore, it will be seen that the block consisted of three buildings—a five-story non-fireproof structure, in the first story of which the fire originated, a seventeen-story fireproof building, and a fourteen-story fireproof building. At the time the fire started, on December 4, 1898, there was a very strong N.E. gale blowing, and it was not long before the clothing establishment was one mass of flames and smoke. Shortly after the flames burst through the roof, when the wind caught and drove them with the fury of a furnace against the main party wall of the Home Life building. In this wall there was a recessed well, which was used as a light shaft about the centre of the building, which was almost entirely pierced for windows. Besides this light shaft there were two windows on each floor in the main wall above the roof of the Rogers, Peet, and Co.'s building. These windows, as well as those in the light shaft, were entirely unprotected from fire, either in respect of shutters or wire-glass in the sashes. If these windows had been protected in some manner, there is little doubt that the harm done

to the building would have been slight, as these shutters would have checked the flames and thus allowed the firemen into the several floors of the Home Life building. However, as the windows were unprotected, and the fire did take place, let us see what lessons can be learned therefrom.

In the first place, let us take the exterior of the building. The walls were of steel-frame, encased on the front with marble, the remainder of the walls being encased with brick. This marble front above the seventh story has been severely damaged by fire, smoke, and water, and will have to be replaced. This proves, however, what is now undisputed, that marble is entirely unreliable in the case of fire. Had this front been of brick or terracotta there is little doubt that, with the exception of a good cleaning and re-pointing, there would have been little to do. This was further proved both by the very satisfactory condition of the north party-wall, which withstood the chief force of the flames, and the terracotta tiling and cresting of the roof, which is almost as good as the day it was erected.

Now, let us enter the building and see what the interior has to show, and what lessons can be learnt therefrom. The floors were constructed of 9in. and 12in. I beams, about 4ft. 6in. apart, having 9in. hard tile terracotta side-construction arches between beams; these arches had show-backs with protecting lip. Above these beams there were sleepers 4in. by 3in. every 16in., with two thicknesses of 3in. flooring nailed thereto. But—mark this item—there was no concrete or other filling in this space under the flooring, leaving an air-space between each sleeper, which formed a flume for the flames. This accounts for the almost entire destruction of the flooring above the sixth story. The terracotta arches, however, were almost all in perfect condition, and in one or two instances where failure did occur, the damage was caused by a heavy safe dropping down this 3in. or 4in. air-space after the flooring had been burned through. The plate girders, where exposed below the arched floors, were covered at each side with terracotta blocks, but the lower flange was covered in most cases with wire lathing nailed to the blocks and carried under the flange. The mortar and lathing were destroyed in many cases, and it is a wonder that the girders have not been damaged. The girders

should in all cases have their flanges covered with terracotta slips, or, at any rate, even if wire lathing is used, it should be most carefully fastened. In many cases, at the Home Life building, the porous terracotta partitions, which were of 4in. material, ran alongside the girders where they joined the ceiling, and in these cases the wire lathing was nailed to the block on the girder on one side, and to the side of the partition on the other side. And as the partitions were constructed (in the passages especially) often-times only 5ft. high, and a sash up to the ceiling, these partitions fell in many cases, carrying these strips of wire lathing attached to these girders with them, and thereby exposing the flange of the girders. It should also be borne in mind that, in the event of wire lathing being used, there should be an air-space of about 1in. between the lathing and the flange of the beam, so as to allow a good key for the plaster or mortar. In many cases the lathing is fastened tight to the flange, thereby destroying any chance of a firm key to the plaster, which therefore falls far sooner than it otherwise would do. The columns were all covered with 2in. porous terracotta tile, and there does not appear to be any damage to this material or to the columns.

These notes give some idea of the condition of the building after the fire, and the lessons to be drawn therefrom may be summed up as follows:—(1) That one of the chief dangers a fireproof building has to contend against is a severe fire in an adjoining non-fireproofed structure; (2) that marble is useless to contend against fire, as demonstrated by the front of the Home Life Insurance building; (3) that the space above the terracotta arches between the steel beams should have been filled with terracotta blocks, concrete, or some incombustible material; (4) that wire lathing and mortar is not to be recommended as a covering for steel construction, and, if used, should be very carefully fastened with an air-space of 1in. between the iron and the lathing, so as to allow space for a good key to the mortar.

J. RAWSON GARDINER.

Temple Building, Montreal, Canada.

#### THE DISPUTE IN THE BUILDING TRADE.

A JOINT meeting of representatives of the National Association of Master Builders and of the several trade unions in the building industry was held at the Midland Hotel, Derby, on Monday, to consider a suggested basis of discussion at a conference to be held for the settlement of the matters in dispute. The meeting was attended by three members only from either side, with the secretaries, namely, Messrs. B. I. Greenwood (London), R. Neill (Manchester), W. Nicholson (Leeds), and J. A. S. Hassal, secretary, employers; and W. T. Wilson (Amalgamated Society of Carpenters and Joiners), W. Matkin (General Union of Carpenters and Joiners), J. Batchelor (Operative Bricklayers' Society), and G. B. Cherry (Operative Plumbers' Association), secretary. No basis was agreed upon; but it was decided that the representatives of the trade-unions should submit proposals for a basis of discussion for the consideration of the National Master Builders' Association within the next fourteen days. The representatives of the trade-unions will meet in Manchester on Monday next to prepare a "basis" for any conference between them and the Master Builders' Association. The basis will probably take the simple form of a proposal for a Joint Central Conciliation Board, composed of an equal number of representative employers and members of the trade-unions, with such other small additions as may be deemed advisable. Meanwhile, the lock-out is continued in Yorkshire.

#### CARTWRIGHT MEMORIAL HALL, BRADFORD.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

WE publish full illustrations of the chosen design selected by Mr. Alfred Waterhouse, R.A., the assessor for the Bradford Town Council. The architects thus commissioned to do this important undertaking are Messrs. J. W. Simpson and E. J. Milner Allen, of New Inn, Strand. The block plan given with the text shows how the authors have devised the general scheme on the site. They took advantage of the liberty given to competitors to adjust the transverse axis line so as to bring the site into line with the statue

of Sir Titus Salt. This will form the centre of the main approach to the new building, the intermediate space being laid out as a formal garden with bandstand and spacious promenade. The differences of level allow an upper terraced garden flanking the hall, and agreeably connecting its severe lines with those of the gardens immediately surrounding it, and of the undulating park beyond. The area occupied by the building is 14,162ft., rather less than the limit fixed by the conditions. The whole of the first-floor galleries are grouped *en suite* so as to form one continuous range of reception-rooms, with the hall and grand staircase in the centre. The cloak-rooms are located right and left of the entrance, thus avoiding the mingling of cloaked and uncloaked guests upon the staircases and rendering ante-rooms needless. The grand staircase in duplicate leads directly into the reception-hall, giving a fine spectacular effect. The drawing-room is placed between the reception-hall and banqueting-room. Royal and distinguished guests would use the black-and-white rooms. Double top lights, as recommended by the late Sir John E. Millais, P.R.A., are used for the galleries; the central hall has north windows for sculpture. The museums and curator's rooms are on the ground floor. The secondary entrances being placed at the half-level, between the basement and ground floor, give convenient access both to the central hall and refreshment room. This latter is equally accessible both from within and without the building as desired, so as to encourage its use as a "café"

with separate tables rather than a "bar." The kitchen department immediately adjoins it. Discreet entrances to the public conveniences to both sexes are provided from the park. The building is designed in a simple style of the Italian Renaissance, based on an order of coupled Ionic columns and pilasters, with an appropriate entablature. An open carriage porch, surmounted by a stone lantern, supplies a relieving vertical composition without interfering with the proper and economical lighting of the galleries or breaking the lines of the roof lights over them. White stone is to be used for the faced work, and slates and lead for the roof covering; the whole to be as far as possible fireproof. Hardwood is to be used for the best joinery. The cost is estimated at £37,073 8s. 3d. The total picture-hanging area is given as 6,948ft. super. The work is to be put in hand at once. Our illustrations from the architects' originals are authorised copies specially made for the BUILDING NEWS, and include the two principal plans and three main elevations, as well as a sheet of details to a good scale.

Lord George Hamilton will unveil to-morrow (Saturday) the memorial to the forty-one Protestant martyrs of Kent, who were burned at the stake at Canterbury during the reign of Queen Mary. The memorial takes the form of a granite obelisk, surmounted by a Canterbury cross, with an inscription recording that by their heroic fidelity, they helped to secure for succeeding generations the priceless blessing of religious freedom.

FIG. 1.

#### OLD CLOCKS AND WATCHES AND THEIR MAKERS.\*

THE work of Mr. F. J. Britten describes in a convenient and popular form the development of the art of clock and watch making. Few were better able to collect the materials for such a book than the secretary of the Horological Institute, who writes *con amore*. As we scan over the 500 pages and its four hundred illustrations, many of them from actual photographs, we are astonished at the remarkable variety of external forms which have been given to these valuable instruments for measuring time. Every conceivable shape that artistic taste could devise has been given, and all who admire the old examples to be found in our museums and private collections will find Mr. Britten's work of much value. The author begins from the earliest time in the history of horology; the sun-dials, water and weight clocks, and wick time-keepers, many remarkable examples being illustrated of those earlier forms of time measurers. The invention of clocks moved by weights is uncertain, and the term "horologium" seems to have been used indiscriminately for sun-dials and clepsydre or water clocks. The earlier clocks were bells sounded at regular intervals by hand. Illustrations are given of the clock at Rouen, the dial of Glastonbury, of Wimborne, of the Palais de Justice, Paris, the famous Strasburg clock, the Venice clock, the dial at Hampton Court Palace.

One of the illustrations (Fig. 1) we are enabled to give, shows a hexagonal table clock from the collection of Prince Soltykoff, of the middle of the 16th century. "The movement is arranged in stories, the watch part being at the bottom, and the striking work above. The six doors or panels between the fluted columns are of steel damascened with arabesques of elegant design." The dial occupies one panel, with a band of blue steel engraved with the hours. Planetary and other motions occupy the horizontal dial at the top. The upper part is in the style of Henri II., six caryatides support the angles of the upper story, and each of the panels has a medallion

\* Old Clocks and Watches and their Makers, &c. By F. J. BRITTEN. London: B. T. Batsford.

with head of a Roman Emperor in high relief, surrounded by a gilt border. A few very unique examples of table clocks and early watches are illustrated belonging to the 16th century. Table clocks or watches of this date are very rare. Some of these are octagonal. One peculiar example in the Soltykoff collection represents a mediæval hexagonal fortress of German make. Our second illustration shows a "Nef" or ship clock, a peculiar fancy of the 16th century. This is a singularly quaint nautical design; the mechanism actuating astronomical movements. Many of the examples are to be seen in the South Kensington Museum and the British Museum. Some of them are in the form of temples, with columns and domical tops, the latter pierced; the bases are often beautifully chased with figures, masks, and cartouched ornaments, as seen in pages 79 and 80. The medallion clock is also a common form, and these have, in some cases, a rock-crystal case on a richly chased stem, with crystal plaques on the base. Timepieces with horizontal dials were another form which found favour, and of these several examples are given. The "Memento Mori" watches of cruciform shape were much in vogue at one time, and two or three interesting examples, engraved with Scriptural scenes and emblems of the Passion, are illustrated. The watches are of various forms—square, octagonal, oval, tulip-shaped, olive-shaped, cockle-shell, and some choice specimens of enamelled French and English watches are represented. Of these some of the most elegant are of the Louis XVI. period, in which the cases are enriched with plaques, enamel, repoussé, and chased work. The list of makers of old clocks and watches is of interest. Mr. Britten's remarks on dials and hands are sensible. The hour numerals, as he says, are now too long, and the old stumpy figures were easier read. The dial maker now regards his work without reference to the hands. There are many points in the old designs of dials and hands that the modern maker may imitate with advantage. The old "Atlas" clocks, as that of M. Grollier, in which the movement is within the globe, a horizontal band marked by numerals revolving a fixed arrow indicating the time, was a favourite device that admitted of much artistic invention. Many of

FIG. 2.

the 18th century clocks are interesting as designs, and the Windsor Castle collection is said to be a fine one. In the Palace of Versailles are to be seen also a few unique examples of this date. Various "grandfather" or Chippendale cases are illustrated, and these have now an interest for all collectors. All interested in this phase of art ought to purchase Mr. Britten's work.

#### HEXHAM ABBEY CHURCH.

THE rector of Hexham and the committee appointed to carry out the restoration of Hexham Abbey Church, have received the joint report of the architect, Mr. C. C. Hodges, and of the consulting architect, Mr. Temple Moore, upon the present state of the church, with proposals for its repair and a scheme for its extension and refurnishing, so as to materially increase its accommodation. It is proposed to begin by building again the nave in the style of the 15th century. The nave or body of St. Wilfrid's Church appears on various evidences to have occupied part of the ground used as a churchyard, immediately to the west of the present church, and which was closed for burials on May 31, 1859. St. Wilfrid's nave stood, in whole or in part, till April 8, 1296, when it received such damage at the hands of the Scots that it was not repaired to any great extent, if at all, in its then form. Its re-erection in the Gothic style was postponed from continual wars and want of means until the latter part of the 14th century, when an effort was made to complete it in a plain and heavy phase of Perpendicular peculiar to the North. How far the work proceeded is not now discoverable, but the south and west walls were standing to a height at least of 20ft. in 1795; as Carter shows a portion of the walking gallery in the south wall, and the jamb of a Perpendicular window above it. At present the south and west walls are about 16ft. high, and though ruined at the top, are in good condition for a portion of their height. The south wall is 6ft. and the west wall 7ft. 3in. in thickness. In 1881 some small excavations were made on the wall faces inside, and the base of the respond at the west end of the arcade was found to be still *in situ*. In

plan the nave consisted of a main span 26ft. 3in. in width, and 95ft. 4in. in length, having an arcade of six bays on the north and a solid wall on the south. It had a single aisle on the north side, the total width of nave and aisle being 46ft. A new pulpit and reading-desk will be put where the entrance to the crypt is now, and a thousand to twelve hundred persons will be able to see the preacher. The large panels on the west side of the rood screen will be hung on hinges, so that they will fold inwards like doors, and then the screen will be an open one during service, and can be closed at other times. In the transepts chairs will be placed. It is in the choir itself that the greatest improvement will take place. All the old stalls will be put back into their old place at the west end of the choir, on a raised platform with seats for the choir-boys in front. Further east the shrines of Prior Rowland Leochman and Sir Robert Ogle will be placed where they were in 1858. These will then become objects of extreme interest, and will also add to the beauty of the choir. The old sedilia will occupy the second bay from the east on the south side. The altar will be a new one of full size. It will have a screened inclosure, and be brought west to the extent of half a bay. The reredos will be carved, painted, and gilded. The grand paintings of the seven canonised bishops will be placed at the sides of the altar, and will be supplemented with similar work to complete the inclosure. The Frith Stool will stand on the north side of the altar, and become again the bishop's seat. The fine old Mediaeval painted pulpit, a rare relic, will have a position of honour on the north side of the choir, and be used as the pulpit for services held in the choir. Three of the effigies will be laid between the columns of the choir as in some cathedrals. The old font, with its ancient carved cover reconstructed, will stand in the south transept. There will be a vestry in the aisle of the south transept. The total estimated cost without heating apparatus is £9,050. This scheme will increase the accommodation from 600 to 1,200, and will obviate the erection of a new church in Hexham.

#### STREET NOMENCLATURE IN LONDON.

THE London County Council have just promulgated a new series of regulations under the London Building Act, 1894, relating to the naming of new streets and the numbering of houses. According to these regulations, which will come into operation on Sunday, October 1, no name is to be used for a street unless with the approval of the Council, and it must be a name consisting, if possible, of one word, with the addition of "street," "road," or other like term, and not already in use within the county. Only such streets as are leading thoroughfares of considerable length can be designated "roads," and no street under 50ft. in width can be called an "avenue." The names "gardens" and "grove" will only be permitted to be used when the terms seem "appropriate." Another regulation states that names in some way associated with the locality are preferred. Names for terraces or places, or other blocks of houses and sections of streets, usually known as subsidiary names, are not recognised.

With regard to the numbering of houses, St. Paul's Cathedral is recognised as a central point; and the numbering of houses begins at the end or entrance of the street nearest to that building, except where a street leads from a main thoroughfare to a less important street, and then the numbering must start from the main thoroughfare. Taking, therefore, the sides of the street as left and right (assuming that the back is towards St. Paul's) the odd numbers will be assigned to the left-hand side and the even numbers to the right-hand side.

The Kings Norton Board of Guardians decided, last week, not to institute a competition for the proposed extension of the workhouse, but to engage the services of Messrs. Whitwell and Son, architects, to report on the requirements and to prepare plans and estimates. The estimated outlay was stated to be about £30,000.

At the Bootle Town Hall, the other day, Major-General Crozier, R.E., held an inquiry with regard to an application made by the Bootle Town Council for sanction to borrow £7,620 for the reconstruction of a sewer in Strand-road. Mr. J. Crowther, borough surveyor, explained the proposals. There was no opposition to the application.

#### THE BUILDER'S WHERE IS IT?

MESSRS. GEORGE M. CALLENDER AND CO., of 11, Victoria-street, Westminster, have issued a very handy shilling booklet, comprising a comprehensive index of the specialities used in the building trades, and the names and addresses of their manufacturers. About one thousand specialities are named, and 500 separate addresses are given. The book is of a handy size, and the classification is compact and easy of reference.

#### CHIPS.

Mr. W. F. D. Smith, M.P., will lay the foundation-stone of new municipal buildings at Henley-on-Thames to-day (Friday). Mr. Henry T. Hare, F.R.I.B.A., is the architect of the town-hall, which was illustrated, from the author's drawing now hung at the Royal Academy, in our issue of the 5th ult.

At the Manchester Town-hall, on Friday, Mr. E. A. Sandford Fawcett held an inquiry for the Local Government Board into an application by the city council for sanction to borrow £30,000 for repairing and strengthening the Moston Brook culvert between Green Mount and the river Irk, in accordance with plans by Mr. Wilkinson, C.E., and £3,000 for the equipment of the Harrison-street lodging-house. Mr. T. de Courcy Meade, the city engineer, explained the proposals.

The town council of Bridgnorth received 46 applications for the appointment of borough surveyor, rendered vacant by the death of Mr. W. F. de Wend Fenton, and have elected Mr. Samuel Trevor, son of the borough treasurer.

The Ruabon School Board have resolved to erect a new school at Johnstown, Ruabon, at a cost of £3,800. Alterations and additions are being carried out at the Rhos Board School at a cost of £634. A new infants' school is about to be built at Rhosyllen at a cost of £1,590.

A special committee of the corporation of Oldham, who have been considering whether the present town-hall in Yorkshire-street should be enlarged or a new building erected on a fresh site, have resolved to seek the advice of Mr. Alfred Waterhouse, R.A., on the whole question.

At Droitwich, on Saturday, a new station on the Great Western Railway system was opened. The erection of the station has been rendered necessary by the increasing number of visitors to the Brine Baths. It has cost nearly £7,000, and the platforms, 500ft. long, are on a level with the floor of the carriages. There are sheltering verandahs, with glass let into the roof, both within and without the station.

The only features of interest to our readers in the commonplace Birthday list of "honours" this year are the knighthoods conferred on Mr. L. Alma-Tadema, R.A., and on Mr. Walter Armstrong, the Director of the National Gallery of Ireland.

A Local Government Board inquiry was held at Teignmouth yesterday (Thursday) relative to the application of the district council to borrow £1,250 for gas undertaking, £150 for a convenience on Shaldon beach, and £60 for street improvement.

The sales at the Mart last week, as registered at the Estate Exchange, amounted to £163,947. The sum in the corresponding week of last year was £86,680.

Colonel A. G. Darnford, R.E., Local Government Board inspector, visited Selby on Friday to hold an inquiry into the application of the Selby Urban District Council for sanction to borrow £5,000 for the purposes of public baths, as well as £540 for water supply to East Common, &c. Mr. Walter Hanstock, of Batley and Leeds, architect to the council, explained the public baths which were proposed to be built in the park, the total cost of which was £5,000.

A new Franciscan convent and chapel were opened at Bocking on Thursday in last week. The new buildings are close to the main road that leads to Bocking and Braintree from Halstead. They are in the Perpendicular style, and have been erected by Messrs. A. Brown and Sons, of Braintree, from designs by Mr. J. F. Bentley.

The foundation-stone of a school for the Roman Catholic blind, was laid on Saturday in Yew Tree-lane, West Derby. The architects are Messrs. Sinnott, Sinnott, and Powell, Harrington-street, Liverpool, and the contractor is Mr. M. Fogarty, Old Swan. The school will be a long two-storied structure, intended for the reception of boys and girls under 16 years of age. The building, which will be of plain Gothic design, in brick, will also embrace kitchen, laundry, and dining-room, one half of which will be used as a temporary chapel, with dormitories for 26 children and an infirmary with six beds. The cost, inclusive of furniture, will be £4,000.

#### OBITUARY.

MR. JOHN SMART, R.S.A., the popular Highland landscape artist, died at his residence in Edinburgh on Friday. He was born in 1838, his father being an engraver, and began art studies in the schools of the Board of Trustees in Edinburgh in 1851 as a designer and engraver. Mr. Smart studied painting under Horatio MacCulloch in 1860, was elected Associate of the Royal Scottish Academy in 1871, and Academician in 1877. He was one of the founders of the Royal Scottish Water Colour Society. His chief works in oil were: "Where Silence Reigns," "Gloom of Glen Ogle," "The Graves of our ain Folk," "The Crofter's Moss," "The Land of MacGregor," "A Glen without a Name," and "The Cradle of Argyll." His water-colours include "Among the Silent Hills," "The Green Island, Loch Shiel," "The Pass of Brauder," and "The Golf Greens of Scotland."

MR. THOMAS TURNER, stone merchant, of Rock-terrace, Lightcliffe, died on Friday, at Dr. Jessop's Hospital, Leeds, after an operation, aged 58 years. He was head of the firm of Thomas Turner and Son, stone merchants, and quarry owners, Lightcliffe and Brighouse, was one of the best-known business men in the Yorkshire stone trade, and occupied a prominent position in the Yorkshire Quarry Owners' Association. His connection with Lightcliffe Congregational Church and Sunday-school was lifelong, he being superintendent of the latter. Twelve months ago Mr. Turner was elected on the West Riding County Council.

The electric tramways at Coventry have been extended along the two main routes on the Stoney Stanton-road from Hales-street to the new depot at Priestley's Bridge, which is to be considered to allow of further extension, and along Ford-street to Gosford Green. Mr. Fielder Smith was the resident engineer, and Messrs. Pauling and Sons, of London, were the contractors.

A memorial window has been placed in the Guildhall, York, as a memorial to the late Sir Joseph Terry, four times Lord Mayor of that city, and the unveiling took place last week. The window is of stained glass, and the subject is King Edward IV. at Walmgate Bar swearing allegiance to the House of Lancaster in order to induce the Lord Mayor of York and citizens to allow him to enter the city in 1471; and illustrates the Yorkist period in the history of the city. The window was designed and made by Messrs. Shrigley and Hunt, of Lancaster and London.

The Croydon Town Council have unanimously elected Mr. G. F. Carter, principal assistant to the Leeds city engineer, as deputy borough engineer of Croydon. The applications numbered 106. The salary is £400, with a prospect of becoming borough engineer.

The town council of Stoke-on-Trent have instructed Mr. J. H. Bockett, architect, to prepare plans and specifications of new offices for corporation officials, alterations to the old police-station for the accommodation of county-court officials, and a mayor's parlour; and also to invite tenders for carrying out the work.

Colonel J. T. Marsh, R.E., an inspector of the Local Government Board, has held an inquiry at the town-hall, Leeds, relative to an application by the Leeds Corporation for the sanction of the Local Government Board order to make certain modifications in their York-street insanitary area scheme, for which a provisional order was obtained in 1896.

The corporation of Southampton have referred to the estates committee a suggestion made on behalf of the Hants Archaeological Society that the historic West Gate should be repaired under the supervision of Mr. Percy G. Stone, A.R.I.B.A. (who will, if appointed, give his services gratuitously), and converted into a public museum.

The newly-erected Wesleyan Methodist Chapel at Rushton, Staffs, was opened on Thursday in last week. The chapel will seat about 200 persons, and the schoolroom will accommodate about 150, and the two rooms can be used together. Mr. Clarke, of Smythamley, was the architect, and Mr. Sampson Salt, of Leek, the builder. The cost of the building has been about £1,250.

You want to read George Griffith's new story, "BROTHERS OF THE CHAIN," in the *Weekly Times* and *Echo*, don't you? Better order that paper for June 18 at once of your newsagent, then, or you may miss the first chapter. You remember the demand for his "Angel of the Revolution," "Olga Romanoff," "The Outlaws of the Air," and "The Romance of the Golden Star," and how you couldn't rest till you got *Pearson's* every week to read them. This is as good as the best of them—some say better.

## PROFESSIONAL AND TRADE SOCIETIES.

**THE ARCHITECTURAL ASSOCIATION OF IRELAND.**—A general meeting of the Irish Architectural Association was held at the Grosvenor Hotel on Wednesday, May 31, Mr. J. H. Pentland in the chair. The hon. secretary read the result of the ballot for officers for the ensuing session as follows: President, Mr. G. Sheridan, A.R.I.B.A.; vice presidents, Mr. J. Holloway, Mr. M. J. Tighe; committee, Messrs. Orpen, J. Pentland, R. M. Butler, T. E. Hadman, T. Coleman, L. O'Callaghan, C. H. Ashworth, F. Batchelor, Wm. Scott; hon. treasurer, J. H. Webb; hon. librarian, J. Geoghegan; hon. secs., H. Allberry, F. Hicks; hon. auditors, W. Sandall and J. W. Boucher. Mr. Pentland delivered a short valedictory address. The term of office of Mr. Butler, the hon. sec., having expired, a vote of thanks to him was proposed by Mr. Auberry, and seconded by Mr. O'Sullivan, for the energy and attention with which he had directed the affairs of the Association since its inauguration in 1896. It is proposed that the Association visit Chester for their annual excursion and dinner on Friday, June 30. The following new members were admitted: Messrs. G. G. Lynes, J. Baird, H. J. Lundy, J. M. Mitchell, Wm. Conolly.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—Members of this Association visited Arbroath on Saturday on the occasion of their annual excursion. The president, Mr. James Bruce, W.S., the past president, Mr. Thomas Ross, and the secretary, accompanied by about thirty members, proceeded by train to Elliot Junction, and walked to Kelly Castle, now the country residence of Lord Provost M'Grady. The Castle is situated about 2½ miles from Arbroath on the River Elliot. The oldest portions, built about 1442 by Sir William Ochterlony, have been much added to and altered, and the building now is a picturesque house of red stone, having a fine walled-in garden with yew-hedges 4½ ft. thick. Under the leadership of Mr. T. S. Robertson the party then visited Hospitalfield, the original of the Monkbarns of "The Antiquary." The parish church and the Abbey were next examined. The well-known Abbey was founded in 1178, and the latest additions were made early in the 15th century. The Rev. W. Duke accompanied the members from the Abbey to his church of St. Vigeans, built on the site of a Norman church, and restored 27 years ago by Mr. R. Rowand Anderson, LL.D.

**MUNICIPAL ENGINEERS AT SHEFFIELD.**—The Yorkshire district meeting of the Incorporated Association of Municipal and County Engineers took place at Sheffield on Saturday. Members of the profession from all parts of the country attended in large numbers. The visitors were welcomed to the city by the Lord Mayor (Mr. Alderman Clegg), with whom they afterwards lunched. After a discussion on a paper by Mr. C. F. Wike, on "Ten Years of Municipal Work in Sheffield," the party spent the remainder of the day in visiting various public works under the control of the municipality.

The Metropolitan Asylums Board has referred to an arbitrator the question as to what amount between £230,000 and £176,000 should be paid by them for the property now belonging to the managers of the South Metropolitan School District.

At Kew parish church on Sunday the memorial window to the late Duchess of Teck was formally unveiled. It represents in the upper light Christ in the house of Martha and Mary, and in the lower compartment Dorcas distributing gifts to the poor.

Last week a Local Government Board inspector held an inquiry with reference to the people displaced under the York-street insanitary area, Lambeth. The area covers twenty-five acres, and the death-rate in it during the last few years has been no less than thirty-nine per thousand. The number of people displaced will be 3,119, and it is proposed to rehouse 2,000.

Mr. E. A. Sandford Fawcett, an inspector of the Local Government Board, held a public inquiry at Bramhall on Friday, respecting the application of the Stockport Rural District Council for sanction to borrow £18,500 for the completion of the sewage scheme of the district. Mr. H. H. Turner, surveyor, stated that the original estimate was £17,300. They had not been able to carry out the work for that amount in consequence of the extraordinary difficulties which had been encountered in the construction of the sewerage way, as the land through which they had had to go was soft, swampy, and set with quicksands.

## LEGAL INTELLIGENCE.

**ARCHITECTS' RESPONSIBILITIES.**—In the Edinburgh Court of Session, on the 2nd inst., Lord Kyllachy disposed of an action in which Miss Mary Hope Jameson, Rosefield Cottage, Cargill Terrace, Warrick, sued Frank Worthington Simon, architect, 36, Hanover-street, Edinburgh, for £80 10s. 4d. damages for breach of contract. Lord Kyllachy found for the pursuer, and assessed the damages at £40, with expenses. The pursuer, he said, lately built a villa in the suburbs of Edinburgh, and the defender was the architect whom she employed. There was, fortunately, no imputation on the defendant's character or attainments, which appeared to be of the highest, but the pursuer's complaint was that as the direct result of want of proper supervision on his part, dry rot was introduced into the building, which had caused a great deal of trouble, and had cost about £30 to eradicate. The pursuer might have proceeded, if she had so chosen, against the defaulting tradesmen, but the responsibility, as it happened, lying between the mason and the carpenter, each of them threw the blame upon the other, and the pursuer sought redress against the architect. The defender seemed, apart from his supervision of the contractors, to have taken a good deal of trouble on the pursuer's behalf, and to have had a good deal of correspondence and a good many meetings with her on minor matters. There could be no doubt about the reality of the dry rot, and his Lordship thought there was none as to its cause. It seemed certain that it was generated in what was called the "bottoming" which immediately underlay the cement floors of the scullery, coal cellar, and w.c., which formed part of the ground floor of the villa. This bottoming ought, as specified, to have consisted of about 2½ ft. of broken stone, the uppermost 3 in. being to be of small stones, and to be supplied by the plasterer; and the rest, which was described as "dry stone filling," to be supplied by the mason. In point of fact, the material used, at least the uppermost 3 in. or 4 in., was miscellaneous rubbish. It consisted, according to the evidence, partly of chips of stone, but to a large extent (about 25 per cent.) of shavings, pieces of wood, plaster, sacking, and general sweepings. It was not surprising that the fungus dry rot soon appeared on pieces of rotten wood which formed a considerable part of the material, and thence it spread to the door posts of the kitchen and scullery, which posts were imbedded in the bottoming, and thus passed into the woodwork of the house. The question was whether the mischief having been thus caused, the defender ought in the course of due supervision to have observed and prevented what occurred? His Lordship was of opinion that the defender had failed to show that as to this part of the work he gave due and reasonable supervision or that the want of such supervision was not a materially contributing cause of the mischief which occurred. The fact was that the defender simply trusted to the contractor, his view of his duty being, as he had frankly enough said, that it was enough for him to pay occasional visits once a week or once a fortnight, and that the employer took her chance of any scamping, however serious, which the contractor might perpetrate in the interval. That was a view of the defender's duty to which his Lordship could not assent; it appeared to him to reduce the architect's supervision to a farce. It was not the view of Mr. Ormiston (the Lord Dean of the Guild), who gave evidence for the pursuer. Accordingly he would find for the pursuer.

**PUBLIC-HOUSES AND THE LONDON BUILDING ACT.**—**CARRITT V. GODSON.**—Judgment was given in the Queen's Bench Division on Monday, by Mr. Justice Day and Mr. Justice Lawrence, in this case, stated by a Metropolitan magistrate on a summons against G. Godson and Sons for that they in erecting a building—namely, the Horse and Groom public-house, No. 137, St. John-street, Clerkenwell—did certain things in contravention of the London Building Act, 1894, and that they had failed to comply with a notice of irregularity served on them by a district surveyor of the London County Council. The respondents were the builders engaged in erecting the public-house. The ground floor consisting of a bar, lavatory, and pot-room; the first floor consisting of a public-room, lavatory, spirit store-room, kitchen, larder, and scullery; the second and third floors consist of bed-rooms and living-rooms. The only means of communication between the floors is a staircase terminating in the lobby on the ground floor. The notice of irregularity required the respondents to construct throughout of fire-resisting materials all passages, staircase, and other means of approach to the part of the building to be used as a dwelling-house under section 74 of the Act. In order to get from the street to the lobby and staircase, it is necessary to enter through the door in the front of the bar, and to cross thence through the bar to the lobby, which gives access to the staircase. The door separating the lobby from the bar is to be and the staircase itself and lobby are constructed of fire-resisting materials; but the floor and other parts of the bar are not of fire-resisting materials. The lobby which

gives access to the staircase also opens into a back yard extending from the whole width of the house, and to a depth of 100 ft. There is no exit from the yard except that which leads into the lobby. It was contended on behalf of the appellant that the building was one used in part for purposes of trade and in part as a dwelling-house, and was so used within the meaning of section 74 (2), and that the way through the bar to the lobby and staircase was under the circumstances a means of approach to the part of the building to be used as a dwelling-house, and that not being constructed throughout of fire-resisting materials it was in contravention of the said Act. It was contended, on behalf of the respondents, that the building was not a building used in part for purposes of trade and in part as a dwelling-house; that it was not within the section; and that even if it were that the way through the bar of the publichouse to the lobby was not a means of approach to the part of the said building to be used as a dwelling-house. The magistrate held that the building was not a building used or intended to be used in part for the purposes of trade and in part as a dwelling-house, and that it was not so used or intended to be so used within the section. He also held that, even if it were, the way through the bar to the lobby was not, under the circumstances, a means of approach to the part of the said building to be used as a dwelling-house, and dismissed the summons. Mr. Avory, for the London County Council, said the question was whether the ordinary means of approach was made of fire-resisting materials. The means of approach was through the bar, and that was not made of any such materials. If this house was not within the section as being partly used for trade and partly for living in, it was difficult to say what house would be included. Mr. Wooten, for the respondents, contended that the building was not within the section. This was not a house used partly for trade and partly for dwelling in. It was used entirely for trade. It was all licensed. In another sense it was all a dwelling-house. He referred to the use of the word dwelling-house as applied to licensed premises in the Licensing Acts and in the Inland Revenue Act, 1880, 43 and 44 Vict., c. 20, section 43. Secondly, upon the point as to whether this was an approach to the dwelling-house made of fire-resisting material, there was a way in from the yard that was a sufficient approach. The section only applied to cases where there was a hard line between the trade premises and the dwelling premises. In this case there was no such line. The whole building was a public-house. The Court upheld the view of the magistrate. Mr. Justice Day said there was great difficulty in applying the section to a building of this description. The only matter in which it came within the section was because it was of the requisite size. He could not see that this was "a building used in part for purposes of trade and manufacture and in part as a dwelling-house." A publican carried on his business all through the licensed premises. In addition, there was in this building a staircase leading to an open space. That staircase was made of fire-resisting material. At any rate, the learned magistrate's decision must be upheld unless the Court were satisfied that he was wrong. He did not see any sufficient reason for interfering with his construction of the section. Mr. Justice Lawrence concurred. The section in question did not apply to a case of a public-house such as this. It applied to the more ordinary case of a shop with living-rooms over it. He thought that the magistrate's decision was correct on that point, and it was not necessary to go beyond that.

**BRADFORD ARBITRATIONS.**—The awards have been made in the arbitration proceeding between the Bradford Corporation and Mr. Tom Twivey, Tennyson-place, and Mrs. S. Lofthouse, of Tennyson-place, in respect of property required for the Tennyson-place improvements. Mr. Twivey's claim was for £496, and Mr. B. W. Jackson, the umpire, has awarded £107 5s. Mrs. Lofthouse claimed £1,360, and has been awarded £522 10s.

**HOW TO IMPROVE WELSH BRICKS.**—His Honour Judge Wynne Ffoulkes was occupied at the North-wich County Court for six hours on Wednesday week in hearing an action brought by Charles Mountain Blades, an analytical chemist, of North-wich, against Charles Wheldon, of the Erith Brick, Tile, and Terracotta Company, Coed Talon, Mold, to recover £50 for special professional services rendered to the company. In opening, Mr. Jackson explained that in November of last year the defendant wrote to plaintiff asking if he was prepared to advise a remedy for the scumming of bricks, with which they were troubled, and what charge would be made. Plaintiff pointed out that it would first be necessary for him to analyse the clay, and after some correspondence he agreed to analyse four samples at £1 is. each. This analysis had been made, and had been paid for. Correspondence followed, the defendant expressing anxiety to learn how to improve the colour of red and blue bricks. Defendant also had an interview with the plaintiff, who agreed to endeavour to

practically effect an improvement by burning samples in his own furnace as tests, and furnishing samples for the defendant to burn in his own kiln. He stated that for the trials he would make no charge until a successful result was obtained, when it would be a matter of mutual agreement as to the fee. The defendant wrote thanking him, adding that he would at once avail himself of plaintiff's professional assistance. Plaintiff then commenced tests, made bricks, and sent samples to be burned at the defendant's works. The work extended over ten weeks, and during the whole of the time the defendant expressed the utmost anxiety to obtain a blue brick without dipping, and something equal to a sample Ruabon brick. On Jan. 25 plaintiff had written that, having made his experiments, he would be glad if defendant would make an offer of remuneration for the production of this class of goods, so that there would be no misunderstanding. Defendant replied that he was under the impression that for any discovery in the improvement in colour a charge would be made, and he would be quite pleased to rest upon it being reasonable. On Feb. 25 plaintiff went to defendant's works. He had at that time worked out a process for producing a blue brick by chemical means. When he got to Mold the defendant was extremely anxious to know if he could proceed to the manufacture of the bricks he required. Plaintiff informed the defendant of another scheme which produced the result, upon which they claimed, and mentioned a more costly method than that elaborated, and which would produce successful results. This method enabled the defendant to go on with a big contract for the railway company. In the course of the interview the defendant said he was careful to use his salt dry, and the plaintiff then explained to him how he could get blue colour by using wet salt. The elaborated process which was not revealed would produce a blue colour through the mass of the brick. On the 1st March plaintiff wrote that the process he had worked out would be of great value, as it would obviate dipping, and the effect on the brick was to improve its solidity. Under the circumstances, he thought he was justified in asking defendant for a cheque for £25 on account of £50. Defendant wrote that he could not comply with this request for the reason that he much over-estimated the value of the process. Further letters followed, and defendant finally wrote that he was willing to pay £5 down and a further £5 when the secret process was disclosed. Plaintiff gave evidence to the foregoing effect. His Honour thought there was evidence of a contract, and that the words "a successful result" were very elastic. It might not mean "the most successful," but as long as there was any improvement in the defendant's bricks he thought it might be called a successful result. For the defence Mr. Tobin denied that the plaintiff gave the defendant a disquisition as to the wet salt process. As a matter of fact, defendant had always used wet salt, and plaintiff merely impressed upon defendant the advisability of doing what they had been accustomed to do. James Gavotte, manager for Mr. Edmund Gavotte, railway contractor, Liverpool; Joseph Roberts, brick burner to the defendant; Charles Wheldon, the defendant, and Edward Wheldon, J.P., manager of the defendant's works, gave evidence. His Honour, in giving judgment, said the painful part of the case was the contradictory nature of the statements made with reference to the interview of February. The process of applying wet salt was abundantly proved in his (the judge's) judgment to have been known perfectly well, and to have been observed at defendant's works for a considerable time, and therefore there was no value in whatever the plaintiff recommended. Judgment would accordingly be given for the defendant.

**IMPORTANT APPEAL UNDER THE WORKMEN'S COMPENSATION ACT.**—EDWARDS v. GODFREY.—This appeal from an award of the Wandsworth County-court Judge upon proceedings to assess compensation under the Workmen's Compensation Act, 1897, was heard in the Appeal Court on May 16, by Lords Justices A. L. Smith, Vaughan Williams, and Romer. The respondent, Edwards, was in the employment of the appellant, Godfrey. The respondent was employed on a building over 30 ft. in height, upon the top story of which a studio was being erected. A scaffolding was used in carrying out the work. The respondent was employed in glazing the studio, and on September 12, 1898, he was descending from the outside of the studio when he fell to the ground and was injured. The respondent brought an action against the appellant in the Wandsworth County-court under the Employers' Liability Act, 1880, and this action was tried on January 9, 1899, before a jury, when the jury found that the respondent was guilty of contributory negligence, and judgment was given for the appellant. No application was then made on behalf of the respondent to assess compensation under the Workmen's Compensation Act, 1897. On January 30, 1899, the respondent took proceedings to recover compensation under the Act of 1897, and on March 13 the County-

court Judge made an award in his favour and assessed the compensation at 11s. a week. Mr. Gover, for the appellant, contended that by section 1, subsection 2 (b) and subsection 4, of the Workmen's Compensation Act, 1897, the workman could claim compensation either under the Employers' Liability Act, 1880, or under the Act of 1897. He could not take two independent proceedings. By section 1, subsection 4, of the Act of 1897, if an action was brought to recover damages independently of that Act, and the action was dismissed, the Court might, if the plaintiff chose, proceed to assess compensation under the Act of 1897, and might deduct from such compensation the costs caused by the plaintiff having brought the action under the Employers' Liability Act, 1880. That was in favour of the workman, and if he did not apply for compensation to be then assessed under the Act of 1897, he could not subsequently take proceedings under that Act. If he could take subsequent proceedings, then the employer would be deprived of the advantage of having the costs to which he was put by reason of the plaintiff having wrongly sued him under the Act of 1880 deducted from the compensation. Mr. Colam, for the respondent, contended that the dominant idea of section 1, subsection 2 (b), of the Act of 1897 was to prevent the ordinary right of the workman being taken away, and the latter part of the clause prevented the employer being liable twice over. But neither that subsection nor subsection 4 said that no proceedings should be taken under the Act of 1897 if the action at common law or under the Employers' Liability Act, 1880, failed. Section 1, subsection 2 (b), said that the employer should not be liable to pay compensation twice over, but it did not do away with the double remedy. That subsection only applied to cases where the injury was caused by the personal negligence or wilful default of the employer or of some person for whom the employer was responsible. The County-court Judge was therefore right. The Court allowed the appeal. Lord Justice A. L. Smith said that the workman failed to recover judgment under the Employers' Liability Act, 1880, and in ordinary circumstances that would be an end of the case as between the employer and the workman, and the employer in any subsequent proceedings by the workman for the same cause of action could plead *res judicata*. That finished the action under the Act of 1880. Subsequently the workman took proceedings and obtained an award under the Workmen's Compensation Act, 1897. The question was whether the workman, after having exercised his option of suing under the Act of 1880, could revert back to the Act of 1897. In his opinion section 1, subsection 2 (b), of the Act of 1897 gave the workman, in the circumstances there mentioned, the option of claiming compensation independently of the Act or under the Act. The workman here exercised his option of claiming independently of the Act. If it had not been for section 1, subsection 4, of the Act the matter would then have been *res judicata*. But that subsection gave the workman the advantage, when he had wrongly exercised his option of proceeding independently of the Act and had failed, of having compensation then and there assessed under the Act of 1897 by the Court which had seisin of the case. There was that *locus penitentiae* given to the workman. At the same time a benefit was given to the employer by allowing the Judge to deduct from the compensation awarded the costs caused by the workman having wrongly brought the action. If this were not the true construction of the Act, a workman who had failed in an action under the Employers' Liability Act, 1880, would never apply under section 1, subsection 4, of the Act of 1897 for compensation under that Act, but would always take fresh proceedings under the Act of 1897, in which case the judge could not deduct the costs of the former action from the compensation awarded. Lord Justice Vaughan Williams and Lord Justice Romer concurred.

**SPRAGUE v. SPRAGUE AND LIHME.**—AN ARCHITECT'S PETITION FOR DIVORCE.—In the Divorce Court, on Tuesday, Wednesday, and yesterday (Thursday), Mr. Justice Barnes and a special jury heard this action, which was a petition presented by the husband, Mr. William George Robert Sprague, a well-known theatrical architect and surveyor, praying for the dissolution of his marriage with his wife, Alice (née Beer), on the ground of her alleged misconduct with the co-respondent, Arthur Lihme. The allegation in the petition was denied by the respondent and co-respondent. There was a claim for damages. Mr. Deane, in opening the case, said that the parties were married on December 11, 1890, at St. John's Church, Brixton, and one child had been born of the marriage. The petitioner, an architect, had been at school in London and Paris with his wife's brother and also with the co-respondent. After the year 1894 the co-respondent, who had always been on terms of intimacy with the petitioner and respondent, came more and more frequently to their house, until it became so noticeable that remonstrance was had recourse to. Matters came to a head in August, 1897, and the co-respondent, in order to allay the

suspicious of the petitioner, wrote a letter to the respondent asking if it was not with her husband's full consent and knowledge that he was at Sandown during part of this holiday. The petitioner replied, as was alleged by him, at his wife's dictation, saying:—"... It is a pity some people have so little to do that they must try to make mischief out of nothing and set about scandalous statements or hint such things. However, we are old friends enough not to take notice of such nonsense. As to your visit to Sandown, this was my invitation, and I feel sorry it should cause 'Mrs. Grundy' to sigh." The incident was then closed until the petitioner was again put on his guard in November of the same year, when it was alleged that they were in the habit of meeting in the woods at Ravensbourne. There at last they were seen on many occasions on such terms of familiarity that on the representations of the lady's brothers the co-respondent agreed to marry her if the petitioner divorced her. On the other hand, the respondent, Mrs. Sprague, was called, and denied that she had ever committed adultery. Yesterday (Thursday) Mrs. Sprague was severely cross-examined, and her brother, Albert Ernest Beer, and other witnesses were heard on her behalf. Sir Edward Clarke, Q.C., M.P., had opened his address on behalf of the respondent, when the case was adjourned until to-day (Friday).

#### CHIPS.

Messrs. Langridge and Freeman, of Tunbridge Wells, and Queen-street, London, E.C., have been appointed surveyors to the Isle of Sheppey Light Railway Co., and they are already taking steps for acquiring the land required for the line to be constructed from the present Queenborough Station to Laysdown, a distance of about eight miles.

Colonel Durnford, Local Government Board Inspector, held an inquiry at the Guildhall, Beverley, on Friday, with reference to an application of the corporation to borrow £10,000 to enlarge the gasworks. Mr. J. Gibson, gas manager, explained the plans and the nature of the proposed enlargement of capacity. There was no opposition.

The ceremony of cutting the first sod of the proposed new road and railway on the north bank of the Tees opposite Middlesbrough was performed on Friday by Sir Lwthian Bell, and later in the day Sir Joseph Pease, M.P., laid the foundation-stone of the new Tees Conservancy Offices in Queen's-square, Middlesbrough, now being erected from plans by Messrs. J. Mitchell Bottomley and Edward A. Whipham, joint architects. The road and railway are for the purpose of developing the large areas of land on the Durham side of the Tees, and will extend from Port Clarence to Greatham Creek, and from Haverton-hill to Billingham, thus covering the vast salt deposits of south-east Durham.

Wednesday in last week was a gala day at Bury St. Edmunds, for three new institutions were then publicly opened—the ancient building on the Cornhill known as Moyse's Hall, formerly a police-station, and now converted into a museum; a school of art in a building which has successively been a corn exchange and a provision market; and thirdly, the new fire-brigade station.

At St. Anne's Park, Bristol, the memorial stones of a United Free Methodist school-chapel was laid on Monday. The building measures 40 ft. by 28 ft., with seating accommodation for 200 to 250, and in the rear of this is a vestry, with kitchen and lavatory accommodation. The style is Perpendicular, the walls being built of red Pennant with freestone dressings and tiled roofs. The large room will have an open boarded roof and pitch-pine dado. The floor will be of pitch-pine blocks, and the windows glazed with leaded lights. The cost will be about £900. The work is being carried out by Mr. E. C. Norris, and the architects are Messrs. La Trobe and Weston, F.R.I.B.A., all of Bristol.

The Duke of Connaught, Ranger of Epping Forest, paid a ceremonial visit to the forest on Saturday, the occasion being the opening of the new Cottage Hospital, at Woodford, erected in celebration of the Diamond Jubilee, and the dedication of the 28 acres of land which Mr. Edward North Buxton has presented to the Corporation as an addition to the 6,000 acres already under the jurisdiction of the City. The hospital, which faces Woodford-green, is of red brick, with half-timbered gables, and is Queen Anne in style. There are two wards to accommodate six patients in each. The first floor contains two wards for paying patients, and on the lower floor is a day-room for convalescents.

The Sewage Committee of the Blackburn Corporation have issued a report recommending the bacterial treatment of sewage by Dibdin's process. They recommend the laying down of five acres of bacteria beds at a cost of £21,000, and estimate that an actual saving can be effected on the method now in use. Experimental bacteria beds have been in use at the Samlesbury sewage works for twelve months, with the most satisfactory results.

CARTWRIGHT MEMORIAL HALL, BRADFORD:  
SELECTED DESIGN.

For description and plan of site see page 772.

## CRESWELL SCHOOLS.

THESE schools are situated on a plot of land close upon an acre in extent, near where the old buildings stood at Creswell Crag, and given for the purpose by the Duke of Portland, who, together with the proprietors of the Bolsover Colliery Company, has undertaken to defray the cost of the scheme, which will amount to upwards of £5,000. The opening ceremony was performed by the Duke of Portland on Whit Tuesday. The work of erection, extending over a period of twelve months, has been carried out by Mr. J. R. Simken, of Bolsover, to the designs of Messrs. Brewill and Baily, architects, of Nottingham, and the perspective is now hanging in the Royal Academy. The school, which will accommodate 450 children, consists of a large central hall, seven spacious classrooms, cloakrooms, and lavatories, with master's and mistress's rooms all ranged over the projecting stone-pillared porches to the separate entrances for the boys and girls commanding the respective playgrounds. The central hall has an open roof, and is surmounted by a bell and ventilating turret, the architecture being of the Gregorian period, and carried out in red sand-faced bricks, with stone dressings, white wood cornice, and green slate roof. The heating apparatus, which is by low steam pressure, was put in by Messrs. Ashwell and Nesbit, Limited, of Leicester and Nottingham, and in the preliminary trials has acted excellently.

## PROPOSED VICTORIA INSTITUTE, WADHURST.

OUR illustration shows a proposed institute to be erected at Wadhurst. It is planned for a site sloping rapidly from the main road, and contains, in the basement, billiard-room, gymnasium, lavatories, &c., and caretaker's rooms; on the ground floor, entrance-hall, with cloak-room, &c., library, kitchen, and bar, with servery; also play-room and reading-room, the latter rooms divided by a movable screen, so as to form one large hall for entertainments. The drawing is now on exhibition at the Royal Academy. The architect is Mr. J. Bartlett, M.S.A.

## NEW WORKHOUSE FOR GREENWICH UNION.

THIS new workhouse, illustrated from the designs of Mr. Thomas Dinwiddy, of Greenwich and Parliament-street, S.W., is now in course of erection at Grove Park, Kent, at a contract cost of £175,020, for the Guardians of Greenwich Union. The building is planned to provide accommodation for 816 aged and able-bodied inmates, as a supplement to the existing workhouse at East Greenwich. The site, of irregular form, has an area of  $9\frac{1}{4}$  acres with a front-

age of about 600ft. to Marvels-lane. The grouping of the buildings is shown by the block plan. At the entrance are lodge and visiting-departments with receiving-wards for male and female inmates, clothes and furniture stores, &c., to the left and right. The administration block is centrally placed, and is connected with the nine pavilions and the chapel by open-arched corridors. It contains offices and committee-room, and residences for master and officials in the front portion, and central store (66ft. by 27ft.) with gallery, clothes-stores, linen-room, mess-rooms, central dining-halls for aged (67ft. by 67ft.) and able-bodied (67ft. by 37ft.), divided for the two sexes, kitchen, scullery, larders, bread-room, &c., conveniently placed for service to each dining-hall. In the pavilions there is dormitory and day-room accommodation for 262 aged males in three pavilions, for 178 aged females in two pavilions, for 200 able-bodied males in two pavilions, and 100 able-bodied females in a further pavilion. There is also on the female side a block with accommodation for 12 married couples. Two small isolation-wards are also provided in a remote corner. Sites are reserved for future provision to the extent of three further pavilions, in connection with which the dining-halls in the administrative block have been planned to allow of extension at any future time without disturbance of the first buildings. The chapel, to seat 400, is situated to the rear of the administrative block, and is centrally placed between the different classes and sexes. In a block next the able-bodied pavilions are provided the laundry departments with engine and boiler-houses, bakery, &c. Flour stores are placed in the water-tower, which is surmounted by a 20,000 gallon tank. A scheme for sinking a well is now in hand. Establishment and labour shops, with hand corn-mills and a stoneyard, are planned conveniently near the able-bodied quarter; smaller shops are also provided for the aged inmates. A mortuary and small stable accommodation complete the scheme. The buildings are being faced with red pressed bricks from the Tunbridge Wells district, with a sparing use of Portland stone, and are to be covered with Welsh rag slating. Internally, glazed facings are to be used to the dining-halls, kitchen, larders, stores, &c., also throughout the laundry block. The contract is being carried out by Mr. T. Rowbotham, of Birmingham, whose tender was accepted out of the fifteen submitted.

## PULPIT, ST. ALPHEGE, GREENWICH.

THIS church, with its pulpit, is one of the finest examples of the Wrenesque period. Like the contemporary church of St. Paul's at Deptford, no sure record of the architect is preserved. It is known to have been erected between 1710 and 1718 (when it was finished), but whilst some attribute the design to Nicholas Hawksmoor, local history associates it with John James, architect also of St. George's, Hanover Square. Both were engaged with Sir Christopher Wren in his great work on the spot—the Greenwich College buildings. The finely-carved pulpit here with shown is of dark oak, as are the surrounding galleries with their unique column supports. The illustration is from a pen-and-ink drawing by Mr. T. Norman Dinwiddy.

## MISSION-HOUSE, DALSTON.

THIS building is being erected in Boleyn-road, Dalston, for the vicar of the parish. Its chief use will be that of providing for the parishioners such means of recreation as will be afforded by club and billiard-rooms, a gymnasium, &c. The hall on the ground-floor will be used for the various purposes connected with church work, such as services, meetings, &c., while the small kitchen in the rear is provided for the making of soup, tea, &c. The front of the building is being built in red brick, with dressings of Monk's Park Bath stone, and the roofs are being covered with Welsh green slates. Mr. H. O. Ellis is the architect.

Through the liberality of the Charity Commissioners the church of St. Martin, Owston Ferry, has been renovated, the fabric strengthened and repaired throughout, and the nave re-seated and refurnished at a cost of between £1,200 and £1,300. In addition, a new organ has been erected.

It has been decided to take steps for enlarging St. Mary's Church, Waterloo, near Liverpool, by adding three bays at the west end, at an estimated cost of £3,000. This will raise the pew accommodation from 550 to 800 sittings.

## COMPETITIONS.

SALFORD.—The Barracks Site competition for the erection of a public hall and shops with model cottages for the county borough of Salford is now pending. The plans were received on the 1st inst., and fourteen sets of designs have been submitted.

SWINDON.—Out of twenty competitors in an open competition, the Swindon and District Hospital Board have accepted the joint plans of Mr. G. Halliday, F.R.I.B.A., and Mr. J. W. Rodger, of Cardiff, for the building of a hospital at Swindon, and have given instructions to the architects to prepare the necessary drawings to carry out the work.

WANDSWORTH.—The special committee of the Wandsworth and Clapham Board of Guardians, with reference to the new board offices, have examined the designs submitted (28 sets in all), with the assistance of the assessor, Mr. Alexander Graham, and recommended that the design No. 25 do receive the first premium of £100 and be the design adopted; estimated cost by architect, £20,311. Design No. 12 was awarded second premium of £60, and design No. 20 third premium £40. The recommendation was unanimously carried, and upon the clerk being requested to open the envelopes with corresponding numbers to above and containing the authors' names, the result was:—No. 25, Mr. Cecil A. Sharp, A.R.I.B.A., of 59, Fenchurch-street, E.C.; No. 12, Mr. W. F. Harber, 35, Craven-street, Strand, W.C.; No. 20, Mr. W. Nash, F.R.I.B.A., Bush-lane House, Cannon-street, E.C. We hope to illustrate the successful drawings at an early date.

## CHIPS.

The Unitarians of Liverpool will open next month a new church which will be erected in the Sefton Park district. The building will cost about £25,000 and will accommodate 440 persons.

A special meeting of the Dawlish Urban District Council was held the other day to consider the erection of a landing stage off the viaduct in front of the town, the G.W.E. board of directors having expressed their approval of the site chosen. The council had had before them modified plans drawn up by Mr. Garrett, of Torquay, for the erection of a landing stage on wooden piles, 650ft. out, with a depth of water at lowest tides of 3ft. 6in., and at an estimated cost of £4,050, which the engineer thought might be reduced in open tendering. The proposal and plans were accepted.

The Theatre Royal at Peterborough is to be rebuilt from plans by Mr. J. P. Briggs, of Arundel-street, Strand, W.C.

A group of five almshouses in one block is being built in Robin-lane, Padsey, the late Joseph Salter, of Horsforth, having left £5,000 for this purpose. The buildings are of stone, with dark Westmoreland slates for roofing, and each has separate entrance, outbuildings, and rear space. The architect is Mr. C. S. Wilson, of Leeds and Padsey.

New business premises have just been completed at the corner of Jewin-street and Well-street. The premises are six stories in height, and occupy an area of 15,000sq. ft. Messrs. Ford, Son, and Burrows, of Aldermanbury, were the architects, and Messrs. Kilby and Gayford, of Worship-street, E.C., the builders.

At Rackenford, North Devon, the restored parish church was reopened last week. Whitewash, until recently, disfigured its fine old oak ceiling and stone pillars; there was no chancel, and the high seats were ugly and uncomfortable; a gallery blocked up the fine western arch, and the church otherwise was in bad repair. Under the direction of Mr. A. Blomfield Jackson a new roof has been given to the church, the carved oak ceiling cleansed of whitewash, the sanctuary enlarged, a chancel formed, the whole church repaved and wood-blocked, the seating modernised, and some oak choir-seats, pulpit, and reading-desk placed in the chancel. The outlay up to date has been £730. A further sum is needed to complete the restoration of the tower, which at present has been left untouched.

The opening of the first section of the Sierra Leone Railway took place on May 1. The section now opened for traffic is thirty-two miles in length, and extends from Freetown to Songo Town, but twenty-five miles more are under construction to Rotofunk, and a survey has been completed for an additional thirty-one miles past Moyamba. The section completed has necessitated the construction of eleven large steel viaducts in the first eighteen miles, besides numerous smaller works. Mr. William Shelford, of London and Hull, was the consulting engineer, represented in the colony by Mr. W. Bradford.

## Building Intelligence.

**BIRMINGHAM.**—The new premises of the Old Library at the corner of Margaret-street and Cornwall-street will be opened to-morrow (Saturday). They have been built from plans by Messrs. Cossins, Peacock, and Bewlay, of Birmingham. The elevations are in the English Renaissance style, carried out in Ruabon brick and white Hollington stone, with Westmoreland green slates for the roof. The building consists of two blocks at right angles the one to the other. The internal woodwork is of pitch pine, plaster is used for the principal walls, and wood blocks are used for flooring. Electricity is used for lighting the whole establishment, and there is not a gaspipe in the place. The cost of building is about £10,000, and the builders are Messrs. J. Barnsley and Sons, of Birmingham.

**CHRISTCHURCH, NEW ZEALAND.**—The Chapter of Christchurch have determined to complete the cathedral as a memorial of the fiftieth anniversary of the foundation of the Canterbury Settlement by the arrival of the first settlers on December 16, 1850. They set apart for a cathedral a splendid site in the heart of the city of Christchurch, and as soon as possible they procured plans from Sir G. G. Scott, and began to build. In 1881 the first portion of the cathedral was opened, consisting of nave, tower, and spire. The foundations have been laid and the outside walls built of the transepts, choir, and apse. Upwards of £40,000 have been spent on these works, and it is estimated that £15,000 will complete the building. The proposal to finish the cathedral in 1900 has been received with enthusiasm by the people of Canterbury, and subscriptions amounting to £5,000 have been promised.

**GREENWICH OBSERVATORY.**—The annual visitation of the standing committee of the Royal Societies to the Royal Observatory at Greenwich was made on Saturday afternoon. The chief interest of the day centred in the new Observatory building, which, commenced in 1891, was finished last month. Designed by Mr. Crisp, under the superintendence of the Director of Works of the Admiralty, the structure of red brick and terracotta is intended to accommodate the staff, the photographic appliances, and library. Henceforward it will constitute the Observatory proper, where all the important scientific observations will be taken, the old buildings being converted into departments.

**HORTON, EPSOM.**—The formal opening took place on Saturday of the Manor Asylum erected to accommodate seven hundred patients. The site at Horton, near Epsom, was purchased by the London County Council in 1896, and consists of 1,060 acres wooded ground, for which £40,000 was paid. The old stables and coach-house have been converted into the laundry. On either side of the Manor House temporary buildings have been erected for the patients, which consist of structures framed in wood, having brick foundations, the exterior walls being of corrugated iron, with layers of felt between the wood and iron. The buildings for the use of the patients are all one story high, and each block has a separate scullery and store-rooms. The recreation hall will seat 400 people. The water supply comes from a boring 450ft. deep, and the lighting is by gas. Workshops, laundry, kitchen, and other buildings are provided. There is a block for chronic cases which will house 110 patients; and two infirmaries which can receive 59 cases each. The 700 patients for this asylum will be distributed amongst eight blocks, of which three are already finished. The building works of the Horton main asylum are now in progress, for 2,000 patients, and the ultimate cost of the whole asylum is estimated at £112,000, or about £136 per bed. Mr. W. C. Clifford Smith, A.M.I.C.E., is the architect and engineer. The principal contractors were Messrs. Leslie and Co. (temporary buildings), Messrs. Kirk and Randall (alterations to Manor House, &c.)

**LEEDS.**—The report of the plans committee of the Leeds Corporation states that during the year ended March 25 last not less than 2,800 plans for new buildings or for extensions or alterations passed through the hands of the committee. During the preceding year the number of plans submitted for approval was 2,400. Four or five years ago it was a most unusual circumstance for the committee to have 70 or 80 plans before them.

Now the average number considered at their fortnightly meeting exceeds 100, and at the last meeting plans for the erection of 237 dwellings were submitted. Mr. Towers, the chief building inspector, states that the dispute in the building trade has not yet appeared to have had the slightest effect on the number of plans, which go on increasing almost week by week. At the last meeting of the city council, Mr. Batley, the chairman of the plans committee, announced that although the year ended March 25 last constituted a record year, more plans had passed through the hands of the committee during the past six months than during the whole of 1898. In every suburb of Leeds scores of buildings are in course of, or awaiting, erection. In the neighbourhood of Harehills-road, Harehills-lane, and Burman-tofts, hundreds of new houses have made their appearance during the last couple of years, whilst scores of others are now being erected, or are in contemplation. In Holbeck, Hunslet, Headingley, Beeston Hill, and Bramley, the builders have of late been equally active. Indeed, never have the builders of Leeds had such a prosperous period as during the past two years. Of still more interest is the large increase of late in the number of plans for extensions of works. As to the class of dwelling-houses that has been recently erected, a larger number of small semidetached villas than usual have been built in the suburbs, these apparently letting better than terrace houses. The corporation, taking into consideration the space at the ends of each pair of such villas, do not require so wide a back street as they insist upon in the case of terrace houses. Hence the cost of such dwellings is very little more than that of terrace houses of the same size. There are small semidetached villas on the outskirts of the city, letting at as low a rent as £20 to £22 a year.

**METROPOLITAN ASYLUMS BOARD.**—At Saturday's meeting of this board it was agreed to expend £400 on the construction of models of the North-Eastern Hospital and the Brook Hospital, from drawings and particulars to be supplied by the respective architects, for the Paris Exhibition of 1900. The Works Committee submitted the finished drawings, with descriptive report and architects' approximate estimate of the cost of the school for ophthalmic children which the managers propose to erect at Brentwood. The accommodation provided is for 360 children, with a staff (exclusive of school teachers) of 80, of whom seven will be non-resident. The architects' approximate estimate of the cost of the buildings was £106,600. The plans were approved, and the managers directed that they should be forwarded to the Local Government Board for their formal sanction under seal. A report was submitted on the subject of the proposed new Southern Hospital, the preliminary plans of the buildings for which institution were generally approved on March 25 last. A committee now submitted drawings for the foundations, together with the architects' approximate estimate (£227,454) of the cost of erection of the hospital buildings, which will contain 720 ordinary and 80 infirmary beds for patients. The drawings were approved. Mr. C. E. Dance was appointed surveyor to the Board, at a salary at the rate of £500 per annum, with travelling expenses, office accommodation, and assistance.

**NOTTINGHAM.**—The General Hospital is being enlarged by the addition of a circular block or Jubilee Wing from plans by Messrs. Alfred Waterhouse, R.A., and Son, of London. The contract for the superstructure has just been let to Mr. Woodhead, of Nottingham. The new block is attached by accessory rooms to the north-east end of an existing long corridor. The position chosen involves the rearrangement and displacement of the existing staircase, and the new wards will be reached by a corridor 81ft. long, placed at right angles to the present corridor. Including two basements, the ward block is five stories high. But only the ground floor, first floor, and second floor which will be occupied by patients' beds. The upper basement is divided into four rooms for servants, and the lower basement provides accommodation for the staff of hospital porters. Each of the circular wards on the upper floors contains room for 18 beds, and the space will afford each 1,800 cubic feet of air. The diameter of the wards will be 60ft. externally, and 55ft. 6in. internally, the walls being about 2ft. thick. There is to be a window between all the beds, except in two interspaces, one of which is occupied by the door of

entrance, and the other by the gangway leading to the sanitary tower. The sanitary block contains on every floor a bathroom for patients, sanitary accommodation for nurses and patients kept distinct, a housemaid's closet, and a room for clinical investigation. The block will be cut off from the wards by bridges, with the usual methods of cross ventilation. Several bridges, 16ft. long, separate the rotunda from the rest of the new buildings. These remaining buildings consist of smaller wards, linen-rooms, and stores placed on each side of the corridor. The new staircase will inclose a passenger lift capable of carrying a recumbent patient. The roof of the circular wards, which is flat, will be covered with an impervious paving, and will form a promenade, in the centre of which, around the chimney-stack, will be constructed a shelter with seats. The walls of the new buildings will be faced with brickwork, relieved with Ancaster stone. Internally they will be lined with glazed bricks. All the floors will be fireproof—made of steel joists incased in concrete, and covered, in the case of the ward floors, with teak. The corridors will be in marble terrazzo. The chimney-shaft, which rises up the centre of the wards, will serve not only for the smoke flues but also for ventilation. There are to be balconies arranged on the sunny side of the bridges of communication upon each floor, where beds can be placed when desired. Mr. G. Reed is clerk of the works.

**PAISLEY ABBEY.**—Plans of the proposed alterations and additions to the Abbey Church have been adopted by the Executive Committee. These have been prepared by Dr. R. Rowand Anderson. The work of restoration is to be carried out by public subscription. The work of restoration will be carried out in sections. The first of these will be the restoration of the transepts and the four great arches of the centre tower, and then will follow the rebuilding of the choir, the foundation and lower walls of which are still intact. The final portion of the work will be the completion of the tower, which will be finished with a saddleback roof, as in the Dundrennan, Sweetheart, and other Abbeys. The cost of the restoration will be £40,000, and of that sum the greater portion has already been promised.

**SPEYSIDE, N.B.**—The Knockando-Glenlivet distillery, built from designs by Mr. C. C. Doig, of Elgin, will be opened on July 1. It has a present capacity of 1,000 bushels, the building being faced with local conglomerate stone, and lit by electricity. The heating is by a Babcock and Wilcox tubular boiler. The frontage of the two stills and also the boiler is built of white enamelled fire-bricks. There is a large warehouse of over 200ft. by 60ft. In connection with the distillery, and in keeping with its scale, there have been erected houses for the Excise officers and workmen.

### CHIPS.

An adjudication in bankruptcy has been made in the case of Harold Wharton, now or late carrying on business as Harold Wharton and Co., late of Liverpool and New Ferry, Cheshire, architect or surveyor.

At a meeting of the creditors of Messrs. Neilson Bros., iron and steel merchants, at Glasgow, on Monday, it was stated that the liabilities amounted to £150,791 and the assets to £22,713, leaving a deficiency of £128,078.

Designs are being prepared by Mr. George Frampton, R.A., for the statue of Mr. William Rathbone, which is to be erected in Liverpool. A statue of Mr. Rathbone's father stands in Sefton Park, near the same city. It is the work of J. H. Foley, R.A., and the panels of the pedestal are by Thomas Brock, R.A., who was Foley's favourite pupil. The panels represent in an emblematic way Education, Commerce, and the Arts and Sciences.

Mr. Hugh Barclay intimated to the Dean and Chapter of Norwich Cathedral, on Tuesday, that he proposed to present the cathedral with an organ, at an estimated cost of £1,300. The offer was gratefully accepted by the Dean and Chapter.

After long delays and many disappointments Lower Thames-street, between Fish Street-hill and Botolph-lane, will soon be widened to a width of 60ft. Some time must necessarily elapse before the various properties can be acquired; but all the freeholders have been served with notices.

The Cefnywaen new school, near Carnarvon, is being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXV., XLI., XLIV., XLV., XLIX., LI., LII., LIV., LV., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

RECEIVED.—W. C. D. A.—G. G. and Son.—S. M. K.—L. S. A. Co.—B. B. and R.

## "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"First Attempt," "Bacchus" "Oak," "Butts," "Astragal," "Thistle," "Speys," "Levenach," "Tokio," "McGilligan," "Desdichado," "Arc."

## Intercommunication.

## QUESTIONS.

[12247].—Foundations by the Sea.—What is the best and cheapest method to adopt in preparing for the above where quicksand and beds of shells abound?—PERPLEXED.

[12248].—Value of Timber.—What is the present cost per foot cube of fir timber at the yard in London, and what would be a fair price per foot cube for fir framed in joists and in roof trusses? An answer by an experienced correspondent will be thankfully received.—G. S. S.

[12249].—Right to Drains.—A bought a plot of land adjoining another owner B, and connected his closet to the drains of B at the back. A finds his drain blocked. Has he any remedy?—G. J.

[12250].—Architect's Responsibility.—Is an architect responsible to his client for the spread of dry rot in a new building superintended by him? It is alleged there was not sufficient supervision in seeing that the spans below the floors were properly ventilated, that air-bricks were omitted, and that damp timber was put in. Do these defects or omissions imply neglect on the architect's part, and can he be made responsible?—A NOVICE.

## REPLIES.

[12244].—Outlet of Closet.—The by-laws of the London County Council under the Public Health (London) Act, 1891, observes "In all cases where he shall connect a lead trap and pipe with an iron soil-pipe or drain, he shall insert between such trap or pipe and such soil-pipe or drain a brass thimble, and he shall connect such lead trap or pipe with such thimble by means of a wiped or over-cast joint, and he shall connect such thimble with the iron soil-pipe by means of a joint made with molten lead, properly caulked."—G. H. G.

[12245].—Gloucestershire.—If "Newcastle-on-Tyne" cares to write to me, I shall be pleased to give him a list of places worth visiting and means of access thereto such as he requires.—T. OVERBURY, 17, College Green, Gloucester.

## WATER SUPPLY AND SANITARY MATTERS.

ACCRINGTON.—The new filter-beds at the Cliffe, Great Harwood, constructed by the Accrington and District Gas and Water Board, were opened on Tuesday. The beds, two engines of 160 H.P., and other appliances have cost about £26,000. Water is obtained from Dean reservoir, filtered at the Cliffe, and then pumped by the engines into the covered reservoir on Smalley Thorn, which is elevated, and will therefore provide greater pressure than has hitherto been obtained. The higher parts of the district can now be supplied with water from Great Harwood.

THE NEW RESERVOIRS AT STAINES.—A party of members of Parliament and others interested in the water supply of the Metropolis visited Staines on Monday for the purpose of inspecting the works which are being carried out by Messrs. John Aird and Sons in connection with the new joint reservoirs of the New River, West Middlesex, and Grand Junction Water Companies. These reservoirs, which will have a storage capacity of 3,300,000,000 gallons, are intended to be utilised as a collecting area when water in the upper reaches of the Thames is plentiful, to be drawn upon at times of scarcity; and if the present rate of progress be maintained, the contractors' task will be completed well within the prescribed time. This means that in two and a half years the upper reservoir will be ready for use, and that in another twelve months the lower reservoir will also be finished. Among those present at the inspection were Mr. John Aird, M.P., and Mr. Middleton and Mr. Hunter, the engineers of the reservoirs.

THE WATER SUPPLIES OF THE FUTURE.—The British Association of Waterworks Engineers held its annual meeting in London on Monday and Tuesday. Mr. W. Watts, of Sheffield, was elected president for this year, and in the course of his address said that during the present session of Parliament about 60 Bills were being promoted for the extension of hydraulic works, the capital of which would amount in the aggregate to several millions sterling, and the capital of existing works already stood at 48½ millions. Probably at no time in the history of waterworks for domestic supply had such gigantic and valuable schemes been before the country. Year by year the population of the country was steadily increasing, and the habits of the people were getting more refined. Sources of water supply were becoming more scarce and difficult to obtain, while the average rate of consumption was increasing. Unless, therefore, means could be devised to lessen the rate of consumption for purely domestic supply, the genius of the water engineer would be sure to be taxed to find water for the want of the rising generation. The roofing space in large towns was capable of collecting supplies of water for many purposes other than for domestic supply if means were taken to store it. The flat roofs of some of the Lancashire cotton mills provided fair supplies of water in case of fire and for other purposes, and it seemed to the president that the plan might be extended to many buildings with advantage. The purification of drinking water was occupying the mind of every waterworks engineer. He was glad to find that every practical bacteriologist suggested the plan which had been so satisfactorily carried out on the Oldham works, where the best water supplies might be found without filtration. In the course of the day a report was submitted from the Water Areas Committee recommending that water supplies generally should be placed under national control and supervision, and at Tuesday's meeting a paper on "The Biology of Sand Filtration" was read by Dr. A. Kemna, of Antwerp; and another on "Auxiliary Water Supplies," by Mr. W. G. Peirce.

The restoration and unflaking of the nave of the cathedral of Norwich has been celebrated by a dinner given to the workmen by Sir Samuel and Lady Hoare. The work now completed has been in progress for nine years, about £8,000 has been expended, and there has not been a single accident.

The foundation-stone of the New Providence Church at Churchbridge, near Oldbury, was laid on Monday. The church, which will accommodate about 400 persons, is to be built at a total cost of £1,300. Messrs. Wood and Kendrick are the architects, and Mr. J. Dallow is the builder.

The foundation-stone of the Milner ward of the infirmary attached to Ecclesall workhouse, near Sheffield, was laid on the 31st ult. The ward is for men, and will cost £25,000.

Some ten miles to the west of Launceston is the hamlet of Canworthy Water, the meeting-place of the parishes of Warbstow, North Petherwin, Jacobstow, and Tremayne, while distant two miles from the nearest church. Here, on Wednesday week, the Bishop of Truro laid the foundation-stone of a mission chapel. The chapel will be named after St. Sidwell V.M., a local saint, but martyred at Exeter. The architect is Mr. E. Sedding, of Plymouth.

## Our Office Table.

THE supply of oak timber east of the Mississippi is practically exhausted, and, as in the case of white pine, American architects and builders are looking out for something to take, so far as possible, its place. European oak is, says a Transatlantic contemporary, too costly for any but the rich to use, and ordinary people must content themselves, if they want hardwood floors or finish, with inferior material, such as ash, or birch, or chestnut. Meanwhile millions of acres of land in the Eastern States are already covered with oak "scrub," consisting of young oak trees, which grow into a tangled and worthless mass, periodically swept away by fires, to start afresh in the same manner a few years later. If this scrub had been thinned out, and, still more, if good trees had been planted, the non-manufacturing portions of the Eastern States, instead of diminishing in population and wealth, as is now the case, would be the scene of solid prosperity and comfort.

THE overwhelming superiority of electric traction over haulage by steam or horse-power on tramways, is demonstrated by the experiences of Leeds, where the city corporation is in the unique position of having all three systems of traction in use at the same time. During last year, according to the official returns just made to the corporation, the average working expenses per mile for each car running in Leeds were—electric, 4.42d.; steam, 9.36d.; and horse, 9.44d.; while the receipts per mile were—electric cars 12.33d.; steam cars, 11.80d.; and horse cars, 9.90d. The experience in that city for the last financial year was, therefore, that while the receipts of electric cars were appreciably larger than those of the others, the working expenses were less than one-half.

A CURIOUS illustration of the working of "trusts" is to be found, says the *American Architect*, in the fact that the first rails for the Boston Elevated Railway have been purchased in England, the management having bought them there for about one-third less than they could be purchased in Massachusetts. At the same time, American iron is sold in England for less than English iron can be bought there, and one English railway has made large contracts for American rails; so that it is by no means impossible that the rails actually delivered to the Boston road may have been rolled in Pittsburgh, sent to England, and sold there to some manufacturer at a price less than he could make them for himself, and by him resold to the Boston company, to be sent again across the Atlantic, and delivered in Boston, after the payment of three-fifths of a cent. a pound, or about 60 per cent. *ad valorem*, for one-third less than the same rails could be bought by the Boston customer directly from the Pittsburgh manufacturer. The explanation of this is that the rail-mill combination, although it can sell at a profit in Europe at less than the cost of European iron in its own country, makes its price to American customers higher than the cost of production, with the addition of 6,000 miles of transportation, insurance, interest, and brokerage, and 60 per cent. duty, knowing that consumers at home will, as a rule, pay this price, rather than adopt the only other alternative, which consists in waiting for rails to be imported.

At the Opera House, Covent Garden, the balcony facing the main entrance has been converted into a spacious and comfortable apartment. Under its new conditions the balcony forms a glass apartment 20ft. long by 30ft. wide, with a height of 21ft. The space between the pillars is reached by doors, and the whole work has been executed from designs of Messrs. Pilbrick, Chadwick, and Co., of Pall Mall East.

Torquay Town Council on Tuesday decided to apply to the Local Government Board for sanction to borrow £20,000 to complete the purchase of the watershed; for £10,000 to cover the excess expenditure, and provide for future extension on the electric light undertaking; and also for £1,500 for a new pavilion at the head of the Princess Pier.

There will be an inauguration at the University Museum, Oxford, on Wednesday next, of a statue of Darwin by Mr. Hope Pinker, which has been presented to the museum by Professor Poulton. The statue is one of a series surrounding the central court of the museum, which already displays at least one other product of the chisel of Mr. Hope Pinker.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Business meeting. 8 p.m.

WEDNESDAY.—Carpenters' Company. Examination at their Hall. 6.0 to 10.0 p.m.

THURSDAY.—Carpenters' Company. Examination at their Hall. 6.0 to 10.0 p.m.  
National Trust. Annual Meeting at Grosvenor House, W. 4.30 p.m.

FRIDAY.—Carpenters' Company. Practical Examination at the Company's Schools, Great Titchfield-street. 9.30 a.m. to 5.30 p.m.

SATURDAY.—Carpenters' Company. Viva voce Examination at their Hall. 12.0 noon.

## THE ARCHITECTURAL ASSOCIATION.

JUNE 17th.—VISIT to GATTON PARK and CHURCH. By 2.6 p.m. train from Charing Cross to Merstham. Meet under clock at 2 p.m. Send P.O. 2s. 2d. to the Hon. A. McGAREL HOGG, 36, Lincoln's Inn Fields, W.C.

G. B. CARVILL } Hon. Secs.  
R. S. BALFOUR }

## CHIPS.

The castle of Duntroon, belonging to Lord Malcolm of Poltalloch, Lochgilphead, Argyllshire, was on Wednesday burned to the ground. Duntroon, which had been repaired and rendered habitable, was situated on the northern shore of Loch Crinan, and was a place of interest to tourists.

An adjudication in bankruptcy has been made in the case of George Atkinson, of Adswood, near Southport, architect; and also in the case of Thomas Newell, of Southall, Middlesex, architect and surveyor.

Mr. Harry Geen, C.C., late borough surveyor of Okehampton, and the representative of that district on the Devonshire County Council, has accepted the post of water and sewerage engineer under the Exeter Corporation, and will commence his new duties forthwith.

At Swinton (near Rotherham), on Tuesday, Mr. W. O. E. Meade-King, barrister, held an inquiry touching the application of the district council for sanction to borrow £2,450 for the purchase of 12½ acres of additional land near the sewage works.

A public meeting was held at Aston on Tuesday in reference to the renovation of Aston Hall, which, although maintained by the city corporation of Birmingham at a yearly cost for mansion and park of £1,300, is almost in the centre of the area of the urban district council of Aston Manor. It was stated that £1,000 would be needed for repairs, and towards this sum about £500 has been promised.

The City Council of Worcester decided on Tuesday to expend £14,000 in providing additional pumping plant and filtering area at the waterworks, for an improved supply of water to the city. Mr. A. Hodder, art principal of the Victoria Institute, wrote tendering his resignation. This was accepted with regret.

At Maindee, near Newport, Mon., a new block of municipal buildings, comprising branch fire brigade station, reading-room, and police quarters, has just been opened. It has cost £3,600, and is described by a local journal with unusual frankness as "devoid of architectural feature of any sort."

The German Empress and most of the Berlin professors were present on Tuesday at the unveiling of the Helmholtz Monument, in the garden in front of the Berlin University. The statue, which is the work of Professor Ernst Herter, is of white Tyrolean marble, and represents the great mathematician and physicist, wearing an Academic gown over evening dress, standing on a pedestal of red Bavarian marble, the front of which bears the simple inscription "Herman von Helmholtz, 1821 to 1894."

Dr. Tristram, Q.C., as Commissary of the Diocese of Canterbury, held a Court in the parish church at Croydon on Tuesday to consider an application for an opposed faculty to throw portions of the churchyard and footpaths into the thoroughfare so as to widen the road at the entrance to the church. Mr. E. Mawdesley, the town clerk, produced the plans and explained the objects the corporation had in view for the benefit of the borough. The judge granted the faculty as prayed, and said that he should insert a special clause as to the preservation of the splendid elm at the church entrance.

The second biennial three days' conference of the members of the Institution of Civil Engineers was opened on Wednesday in the theatre of the Institution, Great George-street, Westminster, by a short address from the president, Sir William Henry Preece, F.R.S. The members afterwards separated into seven sections, dealing respectively with such subjects as railways, harbours, docks, and canals, machinery, shipbuilding, and electricity. The proceedings close to-day (Friday).

A large new Cambridge chime-clock has just been erected in the parish church tower of Watermoor, Cirencester. The makers are Messrs. John Smith and Sons, Derby.

## Trade News.

## WAGES MOVEMENTS.

ARBROATH.—A conference was held on Tuesday between the masters and representatives of the men in reference to the strike of the operative masons for an advance of wages from 8d. to 8½d. per hour. The masters intimated that they were prepared to give the increase, and the offer was accepted on behalf of the men. The strike has thus terminated.

DISPUTE IN THE WORCESTERSHIRE CLAYFIELDS.—The strike at Messrs. Doulton and Co.'s Worcestershire clayfields, Saltwells, which commenced seven weeks ago, became a lock-out on Monday, but was terminated on Tuesday, the men having given in and returned to work. The dismissal of 24 men brought about the trouble.

FLEETWOOD.—About 150 joiners, employed at various firms in Fleetwood, came out on strike on Friday for an advance of a halfpenny per hour, making their pay 8½d. The employers were given notice six months ago of a demand for an advance. A conference between the trade-union leaders and the employers proved fruitless. Many building operations will be brought to a standstill.

NORWICH.—The points raised by various classes of the building trade at Norwich have been amicably settled, after repeated conferences. One halfpenny per hour advance will be given to carpenters, bricklayers, masons, builders' labourers, and painters.

A lychgate of oak from Cheshire is being erected in the churchyard of Brantham, Suffolk. The work is being carried out by Mr. W. Grayston, of Ipswich.

The new fire brigade station which has been erected in King-street, Edinburgh, was formally opened on Friday by the corporation. The building is of three stories, and equipments are provided for a permanent staff. The cost of the buildings is about £12,000.

New premises are being built at Colwick, Nottingham, for Messrs. Lawrence, house furnishers, at a cost of £45,000. The works will provide employment for about 1,000 hands, and are being erected from plans by Mr. W. B. Starr, of Nottingham.

An infants' National school in Avenue-road, Newport, Salop, was opened last week. It has cost £1,500. Mr. Ashton Veale, of Wolverhampton, was the architect, and Mr. E. Whittingham, of Newport, the builder.

Mr. Thomas Hewson, jun., A.M.I.C.E., son of the city engineer, was elected by the Leeds City Council on Wednesday, as general assistant in the city engineer's office, at a salary of £250 per annum.

An inquiry was held on behalf of the Local Government Board by Mr. W. A. Ducat, at Oswestry, on Friday, into an application by the town council for sanction to a loan of £3,500 to meet the cost of proposed new sewerage works.

The parish church of St. Gregory, Heckingham, Norfolk, was reopened on Wednesday after restoration, the builder being Mr. R. Morriss, of Ditchingham, near Bungay. The old box pews have been replaced by oak benches, new floors laid throughout, and the walls recoloured. The interior of the roof of the nave has been clad with stained deal, and the exterior, which is of thatch, repaired where necessary. A new roof has been placed over the north aisle. The chancel has been restored by the rector. The pulpit has been remodelled, and a prayer-desk has been given.

## "SANITAS" DISTEMPER.

A Washable Sanitary Distemper for Whitening and Disinfecting Walls and Ceilings of Passages, Cellars, Stables, Kennels, Sheds, Farm Buildings, Railway Trucks, Horse Boxes, and for General Use.

7lb. Tins, 1s. 9d.; 14lb. Tins, 3s.; 28lb. Kegs, 5s. 6d.; 56lb. Kegs, 10s. 6d.; and 20s. per cwt.

THE "SANITAS" COMPANY, Limited,

BETHNAL GREEN, LONDON,

Manufacturers of Disinfectants and Sanitary Appliances.

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2319.

FRIDAY, JUNE 16, 1899.

WILLIAM MORRIS.\*

THERE are few of us alive now who are capable of predicting the duration of the fame of the "poet, artist, manufacturer, and socialist," the story of whose life has been told so well by Mr. Mackail in these two volumes. Our own opinion is that Morris's reputation will augment rather than decrease, as men grow capable of appreciating the motives that influenced him. We ourselves are very unreliable judges, because in connection with the ideal which he pursued through so many paths, but yet with such undeviating constancy, we felt the influence of William Morris very strongly. Like a good many other people who must have become sick of the shams and sophistries of the politics of late years, we found ourselves years ago irresistibly drawn towards the conception of the "New Order," but as disagreeably repelled by the crudity and vulgarity of some of its apostles, and by the glib optimism of others. If anyone who has read Bellamy's "Looking Backward," and then Morris's "News from Nowhere," feels at all as we felt, he will understand at once how William Morris's conception of the order and life and work of the New Society shaped our after-course; if he doesn't, this is not the place in which to attempt to make him, even if it were worth while. To us it seemed that the picture of the free, wholesome, useful life sketched by Morris was indeed something to live and work for; and that his own career was the ever-constant proof of its possibility and reasonableness. To take men and boys, as William Morris did, with no special training or aptitude or fitness about them, and make them craftsmen, was the sanest and surest guarantee of the certainty of the coming days when England shall once more be peopled by self-supporting tillers of the earth, and makers of useful and beautiful things, and not by gangs of mere labourers and factory hands. When that time comes, the claims of William Morris on the gratitude of our children will need no urging; meanwhile those who knew and loved him will owe Mr. Mackail no small obligation for the record of Morris's life and work which these volumes contain.

The son of a well-to-do bill-broker, who married a daughter of one of the Sheltons of Worcestershire, Morris was born at Elm House, Clay Hill, Walthamstow, on March 24, 1834. His parents moved to Woodford when he was six years old, and Epping Forest was practically his playground. Entered at Marlborough College when he was 14, he left in 1851, and after eighteen months' private tuition, went up to Oxford, to Exeter College, where he made the acquaintance of his most intimate and lifelong friend Edward Burne-Jones. Aristocrat and High Churchman, Morris had in these days serious thoughts of devoting his whole fortune to the foundation of a monastery. Street himself, seven years before, had been deeply engaged with a similar idea, and both probably had caught it from the German painters Cornelius and Overbeck, who a generation earlier had actually started such a community in Rome for students of the theory and practice of religious art. But the religious influence at Oxford that bid fair to land both Morris and Burne-Jones in the Roman Church, as it had landed so many more, was on the wane. Price and Faulkner had brought to Oxford actual knowledge of

the horrors of the great industrial centres of England, and though it was not till long afterwards that these things took full hold of Morris, the easy liver and born aristocrat, their perception effectually shattered the dreams of salvation in the revival of monastic institutions. A tour in Normandy in 1855 with Burne-Jones and Fulford helped to develop the architectural and archaeological bias of his mind, and Morris determined that he must be an architect, and in the following January signed articles with Street and began work in that architect's office in Beaumont-street, Oxford, and at once formed a close friendship with Philip Webb, who was then Street's senior clerk, a position he retained till 1859, when his place was taken by Norman Shaw. Full of ardour, Morris worked hard at his new profession, practising various handicrafts—clay modelling, carving, illuminating, and the like in his spare time. Week-ends in London with Burne-Jones and Rossetti seem to have aided to unsettle Morris, and painting rose for a time almost, if not quite, to the first place in his interest. It is possibly quite true that Street's numerous church restorations may have been uncongenial to his pupil, who already had very strong opinions about the rights of ancient buildings. For a time Morris tried six hours a day of architecture and six hours a day of painting, having removed to London with Street, who had by this time transferred his office there; but Rossetti's influence triumphed, and Morris gave up architecture for the easel, and transferred his affections with all his energy. Ceasing to work all day in Street's office, his lodgings in Upper Garden-street became insufficient for himself and Burne-Jones, who shared them. Burne-Jones, too, was poor, and the lodgings were expensive. In the autumn of 1856, accordingly, they moved to 17, Red Lion-square, where they remained till 1859. Round this house clusters much of what Mr. Mackail calls the "mythology" of Morris's earlier life. Whatever may be the truth about some of these stories, there is little doubt that the furnishing of the rooms in Red Lion-square was responsible for the direction of Morris's mind to his subsequent work as a decorator and manufacturer. With the aid of a neighbouring carpenter the rooms were gradually provided with intensely Mediæval furniture, "tables and chairs like incubi and succubi," as Rossetti called them.

The Bohemian life in London had by this time raised Morris's unconventionality, which had always been extreme, to a still more excessive height. To wear long hair, and a soft felt hat, and to smoke a pipe in season and out of season, was still, as in the earlier days of Clive Newcome, the mark of an artist. But Morris exceeded even the customary license of Gandish's. "Morris went to Jones's on Sunday night," runs a note in Miss Price's diary, "while they were here; and his hair was so long and he looked so wild that the servant who opened the door would not let him in, thinking he was a burglar." He forsook dress clothes, and there is a ludicrous story of his ineffectual attempt to get into Hughes's evening trousers when he was going to dine at high table in Christ Church. To go into society was torture to him, and he never took pains to conceal it. One of the tribulations of these months was the task, equally hard in either case, of evading or accepting the invitations of Dr. Henry Acland, whose intimacy with Ruskin and appreciation of the Pre-Raphaelite school led him to offer constant hospitality to the young painters. Once, when they were to dine with Dr. Acland, Morris invented an illness and sent his apologies by Burne-Jones. Unfortunately, Burne-Jones arrived with this message when there still wanted a few minutes to dinner-time. Acland, who was all kindness, instantly, to Burne-Jones's infinite dismay, put on his hat and went round to see the sick man in his lodgings; he was found, apparently in the best of health and spirits, sitting at dinner with Faulkner and playing cribbage over the meal. He had to confess recovery, and he led off to dinner. Another story of the same period is equally characteristic. At dinner one evening in George-street, Prinsep said something, whether intentionally or not, which offended Morris. Everyone expected an outburst of fury. But by a prodigious effort of self-control Morris swallowed his anger, and only bit his fork—one of the common four-pronged fiddle-pattern kind—which was crushed and twisted about almost beyond recognition.

During this period were written some of the finest poems published early in 1858 in "The Defence of Guenevere and other Poems," and on April 26, 1859, William Morris married his wife, Jane Burden, at

St. Michael's Church, Oxford; Dixon, by this time curate of St. Mary's, Lambeth, going down to perform the ceremony. A six weeks' tour to Paris, Belgium, and the Rhine as far as Basle followed, and the married couple returned to London to live in furnished rooms at 41, Great Ormond-street, till Philip Webb could build their house for them on Bexley Heath, near the little village of Upton.

The reaction from early Victorian stucco had just begun to set in, but had not yet begun to produce any visible effect over the country. Nowadays, when the red brick of the common modern country house is to be seen on every roadside, this, the first house that Webb built, might be passed without any remark by a casual traveller. But Mr. Norman Shaw was then a clerk in Street's office; stucco and slate still reigned supreme in all districts where stone was not the native building material; and the name of Red House given to the new building was sufficient to describe it, without ambiguity to all the neighbourhood. Its planning was as original as its material. The type of house which Morris was fond of describing as a square box with a lid was completely abandoned; it was planned as an L-shaped building, two-storied, with a high-pitched roof of red tile. The beautiful oak staircase filled a bold projection in the angle, and corridors ran from it along both the inner walls, so that the rooms on both limbs of the house faced outward on to the garden. The two other sides of this half-quadrangle were masked by rose-trellises, inclosing a square inner court, in the middle of which rose the most striking architectural feature of the building, a well-house of brickwork and oak timber, with a steep conical tiled roof. Externally the house was plain almost to severity, and depended for its effect on its solidity and fine proportion. The decorative features it possessed were constructional, not of the nature of applied ornament: the frankly emphasised relieving arches over the windows, the deep cornice moulding, the louvre in the high open roof over the staircase, and the two spacious recessed porches. Inside, its most remarkable feature was the large drawing-room, which filled the external angle of the L on the upper floor. It looked by its main end window northwards towards the road and the open country; and a projecting oriel in the western side overlooked the long bowling-green, which ran, encircled with apple-trees, close under the length of that wing. The decoration of this room, and of the staircase by which it was reached, was to be the work of several years for Morris and his friends: and he boldly announced that he meant to make it the most beautiful room in England. But through the whole house, inside and out, the same ideal standard was, so far as possible, to be kept up.

The difficulties of furnishing the Red House according to Morris's mind helped along the suggestion of the firm of Morris and Company, largely due to Madox Brown, and still more to Rossetti. Church decoration was at first the main business of the firm, which consisted of Morris, Burne-Jones, Madox Brown, Philip Webb, Rossetti, Peter Paul Marshall, a surveyor, and Faulkner, who had given up Oxford for civil engineering. Arthur Hughes was at first included, but withdrew before the firm was formally registered. The capital was not a large one. The firm began with a call of £1 per share, and on this and a loan of £100 from Mrs. Morris, of Leyton, the first year's trading was done. Premises were taken at 8, Red Lion-square, a few doors from Morris and Burne-Jones's old rooms. The foreman was a glass-painter, Mr. George Campfield, who had come under Morris's notice as a pupil at the Working Men's College. Mr. Campfield is still in the employ of the firm at Merton Abbey. In January, 1862, a further call of £19 a share was made, raising the paid-up capital to £140, which was never increased till the dissolution of the firm in 1874. Morris and others had, of course, to lend the firm money, and his resources, and in a still greater degree his business-like sagacity and unwearied industry, were the mainstay of the business. Stained glass, decorated furniture, tapestries, &c., were the staple productions at first; the chintzes, paperhangings, and carpets followed in later years. The well-known trellis paper was the first designed, the rose-trellis by Morris, and the birds by Webb. The Daisy paper, though not the first designed, was the first placed in the market. It was at first attempted to print the papers in oil from etched zinc plates; but the process proved tedious and unsatisfactory, and it was soon given up, and the design was recut in pear-tree blocks, and printed in the ordinary distemper by Messrs. Jeffrey and Co., of Essex-road, Islington, the success of that part of the work depending almost wholly on the care and attention of Mr.

\* The Life of William Morris. By J. W. MACKAIL. London: Longmans, Green, and Co. 32s. Two vols.

Metford Warner, the managing partner of Messrs. Jeffrey and Co. In 1865 the firm moved to Queen-square, at No. 26 on the east side, since demolished to make room for an extension of the Hospital for the Paralyzed and Epileptic. Morris having given up the Red House at Upton, took up his residence there, and for the next seventeen years it was the headquarters of his work. The business now began rapidly to extend, thanks mainly to the capability and energy of Mr. George Warrington Taylor, who became its business manager in 1865, and remained such till his death in 1870. Leisure began to grow on Morris's hands, and he resumed, in new forms, the writing of poetry. "The Life and Death of Jason" appeared in June, 1867; the first volume of "The Earthly Paradise" followed in 1868, and, eighteen months later, the second, and the remainder about the end of 1870. In 1873 the workshops in Queen-square had begun to encroach so on the living part of the house that Morris removed to a little house on the Turnham Green-road. Disagreements between the partners began soon after to arise, and, at last, in March, 1875, it was dissolved, and it was announced that henceforth it would be carried on under Morris's sole management and proprietorship. This change seems to have snapped the chain of attachment between Morris and Rossetti, which had long been weakening, and to have caused a breach with Madox Brown, which, however, was healed in later years. Some two years before this Morris had taken Kelmscott Manor House on the upper Thames, thirty miles from Oxford, and in 1878 he took a new house in London, on the Upper Mall at Hammersmith, which he renamed Kelmscott House, after his other home on the same river, and in which he lived for the rest of his life.

For years it had been Morris's desire to transfer the works of his business to some place out of London, and the increasing work made the matter more urgent, as the opening of the separate counting-house and showrooms in Oxford-street made it more practicable. His own first desire was to shift to the neighbourhood of Kelmscott; then Hemel Hempstead and Isleworth were thought of; but the move was finally made to Merton Abbey in Surrey. Many readers, doubtless, have visited that quaint group of sheds and barns by the side of a millpond. If any have ever come away without heartily wishing that every "art-factory" in the land might be demolished to-morrow, and that all over England handicraftsmen might be trained and set to work under similar conditions and amid similar surroundings, he must be of a very satisfied mind with the modern system of "art-manufacture"! We well remember our last visit to the place, and the delight with which Keir Hardie, who accompanied us, contrasted the lot of the workers there with that of his own earlier life in the coal-mine! If William Morris had done nothing more all his lifetime than found and develop the object-lesson he left behind him at Merton Abbey, his claim on the gratitude of future emancipated generations of the common folk of England would rank higher than that of many politicians and "labour-leaders."

Of his more generally recognised work as a Socialist, this is not the place to speak. We need only advise those who failed to understand Morris's position carefully to read the statement as to his motives and convictions, which will be found in the second volume. Like Arnold, he had come to take no very ardent interest in English politics. What interested him was English civilisation; and few honest, thoughtful men, to-day, if they tell themselves the truth, will deny that politics have very little bearing on that! Morris hoped—as many of us have hoped—that at the touch of an external impulse leaders among the workers might arise with

whom he might be permitted to work for better social conditions. He had to realise, after years of disappointment, that the time for this had not yet come. But there was no turning back:—

This renunciation of his own class at all events, so far as such a thing could be actually done, presented itself to him as a step which now more than ever would have, so far as he himself was concerned, real value and significance. His position in the eyes of the world was more than respectable; it might even be described, within limits, as famous. He had a recognised place in the first rank of living poets. He was no less recognised as an authority on all matters relating to the theory and practice of the decorative arts. He was a well-known and (in spite of the temporary embarrassments which attended the first year of the work at Merton Abbey) a prosperous manufacturer, whose goods travelled far, and carried their own guarantee of excellence in design and workmanship. He might speak of renunciation as one who had something not inconsiderable to renounce. Just at the moment when he was making up his mind to take some decisive step, he was unanimously elected an Honorary Fellow of his College at Oxford; a distinction which, always rare, is generally reserved for old members who have attained the highest official rank in their profession, and implies a tribute to very special distinction in one who is not a Bishop or a Privy Councillor. This honour was conferred on him on the 18th of January, 1889. He had gone down to Bournemouth that day to see his daughter. "Such a pile of letters I found waiting me," he wrote to her on the 17th, after coming back to London, "some of them like those of David Copperfield after he had become an author." That same day he enrolled himself as a member of the Democratic Federation.

On his card of membership, which is signed by H. H. Champion, he is described as "William Morris, designer." It was on his status as a workman that he based his claim to admission into the fighting rank of a working-class movement. The step, which in a sense cut him definitely away from respectability, was in no way a merely formal one. He took it with a full sense of its import. "I am truly glad," were his words, with something of the grave joy of a convert, "that I have joined the only society I could find which is definitely Socialist." His support of the new movement, even before he formally joined it, had not been confined to theoretical sympathy. In the previous October he had sold the greater part of his valuable library, in order to devote the proceeds to the furtherance of Socialism.

The drain on his resources was heavy during the whole of his connection with the movement; but he seldom complained, and when at last he severed his official connection with the Socialist League, which was a split-off from the Social Democrat Federation, from which differences with the organisers of that body had caused his resignation, we find him, in November, 1890, very calmly and rationally reviewing his position:—

"It is now some seven years," he writes, "since Socialism came to life again in this country. To some the time will seem long, so many hopes and disappointments as have been crowded into them. Yet in the history of a serious movement seven years is a short time enough; and few movements surely have made so much progress during this short time in one way or another as Socialism has done."

"For what was it which we set out to accomplish? To change the system of society on which the tremendous fabric of civilisation is founded, and which has been built up by centuries of conflict with older and dying systems and crowned by the victory of modern civilisation over the material surroundings of life. Could seven years make any visible impression on such a tremendous undertaking as this?"

"Consider, too, the quality of those who began and carried on this business of reversing the basis of modern society! A few working men, less successful even in the wretched life of labour than their fellows; a sprinkling of the intellectual proletariat, whose keen pushing of Socialism must have seemed pretty certain to extinguish their limited chances of prosperity; one or two outsiders in the game political; a few refugees from the bureaucratic tyranny of foreign Governments; and here and there an unpractical, half-cracked artist or author."

"Yet, such as they were, they were enough to do something. Through them, though not by them, the seven years of the new movement toward freedom have, contrary to all that might have been expected, impressed the idea of Socialism deeply on the epoch."

Too deeply, one trusts, ever to disappear again. Whatever wholesome influences may broaden and extend that impression, none will be more salutary than that of William Morris.

The last years of the poet-artist's life witnessed the awakening of a new interest—in the art of printing, with the happiest results. Had he lived to the age of Methuselah, every succeeding decade would probably have found him attacking some new branch of craftsmanship, so busy was the brain, so untiring the industry of the never-tiring worker. But Morris had not inherited the constitution of a long-liver from his father's family, and domestic anxieties had told on him, and during the summer of 1895 the gradual failure of his strength became noticeable. With the turn of the year the weakness became more pronounced. In the

autumn of 1896 he was sent, not wisely many have thought, to Norway in search of health. When he returned he was evidently a dying man, and on the morning of the 3rd of October he died quietly and without visible suffering. His disease, as his family doctor said, was "simply being William Morris, and having done more work than most men." "I have had a jolly life, on the whole," said Morris to a friend of ours, not long before his voyage to Norway. Doubtless it was, as with most workers, its own best reward.

#### ESTIMATES.—X.

BATH STONE, ETC.

THE labour on Bath stone is about 40 per cent. less than Portland stone, which is the chief reason of its large employment in London and elsewhere. It has been priced at about 25 per cent. less than Portland. As an approximative mode of estimating, a deduction of this percentage may be made from Portland stone for similar items. The price per cubic foot for Box Ground Bath stone at Nine Elms station is given at 1s 6<sup>3</sup>/<sub>4</sub>d. by Laxton; price on railway trucks at quarry, 11d. per foot cube. In ashlar work of an average thickness of 4in., and in courses from 4in. to 14in. high, including one bonder to each super. yard, all worked ready for fixing, the price quoted at the loading station for Box Ground stone is only 5<sup>1</sup>/<sub>4</sub>d. per foot super.; add to this the carriage, hoisting, and setting, say 1s. 6d. per foot super. The prices for labour are proportionately low. Thus the quarry prices quoted for labour on Corsham Down stone by the Bath Stone Firms, Ltd., are given in Laxton, from which we quote:—

	£	s.	d.
Sawn face ..... per foot super is	0	0	1 <sup>1</sup> / <sub>4</sub>
Beds and joints ..... ditto	0	0	2
Ditto ditto sunk ..... ditto	0	0	3 <sup>1</sup> / <sub>4</sub>
Ditto ditto circular ..... ditto	0	0	5 <sup>1</sup> / <sub>4</sub>
Plain face ..... ditto	0	0	2 <sup>1</sup> / <sub>4</sub>
Ditto circular ..... ditto	0	0	3 <sup>1</sup> / <sub>4</sub>
Sunk face, average 2in. deep ..... ditto	0	0	5 <sup>1</sup> / <sub>4</sub>
Ditto stopped ..... ditto	0	0	6 <sup>3</sup> / <sub>4</sub>
Moulded work ..... ditto	0	0	9
Ditto stopped one end ..... ditto	0	1	1 <sup>1</sup> / <sub>4</sub>
Ditto ditto both ends ..... ditto	0	1	3
Ditto circular ..... ditto	0	1	0

Labour on Box Ground stone is about 10 per cent. more than the above, owing to the greater hardness of Box Ground stone compared with Corsham.

For special or large items of Bath stone-work apply to a large stone merchant, or any of the well-known quarry owners or masonry contractors, such as the Bath Stone Firms, Limited, for quotation of price.

We now resume the other items in Portland stone list:—

#### No. 10. Cement joggle joints.

These joints will take each half an hour, say 5d. each.

#### No. 10. Slate dowels in mortises in cement.

The mortises are about 2in. super., 3d. each. The slate dowel 1in. square by 4in. is worth 2d., cement say 1d. The two mortises are 6d., the slate dowel 2d., and the cement 1d., in all 9d. each.

3,560ft. super. Portland stone ashlar 4in. on bed, of varying heights, set in fine mortar and cleaned down.

This can be done at about 2s. 8d. per foot super., or at about 7s. 6d. per foot cube. If there are bond stones, say 6ft. apart, add 1s. per foot super., or 3s. 9d. The price of this item will largely depend on quantity, and a price should be obtained.

120ft. super. Portland stone landings rubbed on face and soffit, including pinning, setting, and scaffolding 3in. thick.

The price at the London depot for 3in. would be about 1s. 3d. per foot super. Add cost of carriage, say 3d., hoisting and setting 6<sup>3</sup>/<sub>4</sub>d., scaffolding 6d., would be about 2s. 6<sup>3</sup>/<sub>4</sub>d. Laxton prices a similar item at 3s. 9d. per foot super.

30ft. run. Cutting and pinning to landings and steps in cement.

Put this at 1s. 2. per foot.

96ft. run. 13in. by 8in. spandrel steps, rubbed all round, splayed soffit and splay rebated (see sketch).

The price of this may be put at about 4s. per foot run. To take one step, say 4ft.

2ft. cube of Portland stone at, say, 3s. 6d.	£	s.	d.
6ft. super. plain face to tread and riser	0	7	0
at 8d.	0	4	0
1ft. 4in. super. sunk rebate at 1s. 2d.	0	1	6
Plain face to splayed soffit 3ft. 6in.	0	2	6
Rubbed, 9ft. super at 2d.	0	1	6

Cost of one step ..... 0 16 6

Equal to about 4s. per foot run.

No. 24. Fair ends.

Put these at 1s. each.

No. 1. Step with semicircular end.

Say, about 1s. 6d. extra.

96ft. run. 15in. by 8in. spandrel steps, with moulded nosings, rubbed all round, splay rebated, with two square ends for building in (see section), 4ft. long.

These would contain more stone, about 3ft. 4in. cube each, the ends being solid for building-in, say, 4s. extra per step, and add for moulded nosings 10d. per foot run, say 2s. per foot run.

No. 6. Spandrel-shaped steps as winders, 6ft. by 18in. by 8in.

These would require about 4in. to 6in. more cube stone each, and more labour, rubbing and fixing, for which add 2s. 9d. each step.

No. 1. Moulded curtail step, built in, about 6ft. long.

Add to former extra stone 1s. 9d., say 3s. for circular moulded end.

4,250ft. super. Bath stone (Box Ground) ashlar, 4in. on bed, set and cleaned down.

This may be put at about 40 per cent. less than Portland ashlar of the same thickness, say 1s. 6d. per foot super.

3,200ft. super. Box Ground ashlar, 6in. on bed, with bond stones 6ft. apart, each containing 18in. cube stone, set and cleaned down.

Add for extra thickness of bed 6d. If the bond stones are 1ft. on face and 18in. in bed, there would be 1c.ft. to add to every 6ft., or one-sixth of a cubic foot to each foot super., and if the price per cubic foot of this stone is 3s. 3d., including waste cartage, hoisting, and setting, we may add 6½d.

Cost of ashlar 6in. on bed, hoisting and setting	£	s.	d.
Extra cost of bond stones, one-sixth of cubic foot, at 3s. 3d. per foot cube	0	2	0
Per foot super.	0	2	6½

1,165ft. cube Box Ground stone to quoins, window-jambs, and lintels, of the sizes shown in drawings, and hoisting and setting, &c.

Before affixing a price to this item the estimator should examine the details; but for ordinary dressings of plain character with little or no moulded work the work may be priced at from 2s. 9d. to 3s. 6d. per cube foot. A more correct way would be to take out rough quantities of a few quoin stones and labour on them, the jambs and lintels of windows, the pilasters, and string-courses, cornice, &c., a few feet of each, and so obtain the average value of a foot cube of these several items.

In pricing a stone pediment, it is desirable to take rough quantities of the springing or angle stones where the horizontal part of cornice and raking pediment meet, and also of the apex stone. We give sketches (1 and 2) of these stones. The dotted lines will show the cube block and the amount of sinking

and moulded work. There would be two sunk faces to the moulded part in front and on the return, sunk-joint at top, and splay sunk, in addition to bed and joint and plain face at back. The labour on each stone would probably cost 5s. or 6s. per foot cube if of Portland, and about half that if in Bath stone. The apex-stone would also have a bed plain face back and front; two sunk joints where the raking portion of cornice joins sunk and moulded face mitre, which would have to be priced. These three stones being taken in cube stone with the labours on them, and a 3ft. length of the straight cornice, an

average may be obtained of the price per foot run of the cornice round the pediment.

In pricing a Gothic gable and coping, there would also be the two "kneelers" or corbel-stones at the springing, and the apex-stone. Each "kneeler" would have ½ bed and joint, two plain faces, two sunk faces, moulding on three sides, and moulding of corbel. The apex-stone would have for its labours a bed, plain face back and front; two sunk joints for coping, a sunk-face to front, sunk work stopped to back and front, moulding and mitres. The labour on Bath-stone for plain work of this description may be priced at 3s.

Quarry-worked Yorkshire stone is generally supplied in the form of templates, pavings, landings, steps, hearths, window sills, bases for columns, &c. Tooled 2½in. paving may be supplied within four miles of London depot for 8d. per foot super., 3in. paving for 9d., rubbed 2½in paving would be about 1d. more per foot than tooled.

220ft. super. York tooled 3in. paving in parallel courses and laying.

Say the cost of tooled paving at depot is	£	s.	d.
Add cartage	0	0	9
For cutting for parallel course	0	0	3
Waste	0	0	1
Mortar	0	0	1
	0	1	4

If the paving is rubbed add 3d.

16ft. super. 3in. York stone tooled landings, including hoisting, pinning, and setting.

Stone at depot, per foot super.	£	s.	d.
Cartage	0	1	2
Plain work to faces	0	0	2
Pinning and setting	0	0	4
	0	2	8

12ft. super. Self-faced landing of York stone.

The price of 3in. York landings delivered is about 1s. 3d. per foot super.

Say cost of stone is	£	s.	d.
Tooting edges, &c.	0	1	3
10 per cent. waste	0	0	3
	0	1	7½

18ft. run. 11in. by 3in. sawn York sill, throated and grooved for iron tongue.

Call 11in. a foot, then say:—

3in. sawn stone costs, say, per foot super.	£	s.	d.
Waste	0	1	3
Sawing, grooving, throating, and setting	0	0	2
	0	1	11

Profit, 10 per cent.	0	0	2
Per foot run	0	2	1

32ft. run. York window-sills 8in. by 3in., rubbed, weathered, and throated and fixed.

We may price this item at 1s. 10d. for Robin Hood stone, and for hard York 2s. per foot run. Fair ends for these may be taken at 3d. each.

16ft. run. Groove for tongue.

The groove would be about ½in. deep, and ½in. wide. Taking the mason's time, we should say a groove would cost 1½d. to 1¾d. per foot. Some estimators have put throat and groove together as low as ¾d.

48ft. run. Tooled York treads, 12in. by 2½in.

If coped out of 2½in. paving, the price for this may be put down at 1s. 1d., add to this tooling to edge, say 4d., setting and profit, say 4d., in all, 1s. 9d. per foot.

20ft. run. 10in. by 6in. York steps, gauged to thickness and fixed (in 4ft. lengths or steps).

Say about ½ cube foot, per foot run	£	s.	d.
Surfaces tooled, 1ft. 3in. super.	0	1	6
Fixing	0	1	8
Cost of 1ft.	0	3	4

#### DUDLEY GALLERY ART SOCIETY.

THE summer exhibition of water-colour pictures and sketches at the Egyptian Hall opens with a display the average merit of which is discouraging. The novice is still strongly in evidence. We see his workmanship in crudely-drawn figure subjects, and in mannered landscapes and weak motives. Our notes are reserved for a few of the better works. Broadly treated are C. Talbot Davenport's views, "Kew Bridge" (6), "Still Evening" (27), and "A Lonely Cottage." Miss Margaret Bernard's decisive and full-brush sketches of "Criel, Billericay, Essex" (15), "Street in St. Ives" (57), "Marshes, Wilts." (75), are pleasing and simple first impressions; the handling of light and colour is firm and brilliant. A large water-colour study of a broad sunset landscape, by Sylvester Stannard, prompted by a well-known verse in Gray's "Elegy," commencing:—

Now fades the glimmering landscape on the sight,  
And all the air a solemn stillness holds

has caught the poet's sentiment. The red glow in the sky, the sheep wending their homeward way, and the fading landscape are feelingly painted. Bessie Wigan, in her vivid colouring of flowering herbage on hills (14), and in one or two other subjects, shows a true instinct for nature. Several other lady contributors are to be noticed, and we here mention Mrs. R. C. Foster's "Fittleworth" (28), Miss J. A. Gilchrist's "Poppyland, Wells, Norfolk" (25), Mrs. Clutterbuck's "On the Campagna" (24). "No Sign of the Boats" (36), by Miss Lucy Miller, is a sympathetic study of coast life. Two fisherwomen and children on a cliff overlooking the sea are straining their eyes to catch a glimpse of the boats that bear the bread-winner home. The fading light and colour are appropriate. The same lady's *penchant* for fisher life is shown also in her Dutch sketch (59), a beach with a group of fisherfolk walking along the sands—a fresh sea coming in. "Peace at Eve" (63), by C. Duassut, is a quiet landscape and church, with patches of water in foreground and a distant

village reposeful. Rose Hake is a dexterous draughtswoman; her "Cobham College, Kent," with its curious corner arch, is a nice sketch of a stone building. Another talented lady artist is Evangeline Jex Blake, whose work is always attractive. Her sketch of "Fountain at St. Lo" (53), is a clear liquid-wash sketch, very sharp and brilliant in handling of the light and shadow; so also is her "After Rain, Teignmouth," broad and full of colour. We must also approvingly mention Hely Smith's "Arab Caravan" (45), a spirited sketch of Arabs in the desert; J. Paul Brinson's "Welsh Moorland," a broad landscape in brown and grey tones; Edith A. Langdon's "Old Farm" (42). Arthur Verey's "River Yare" is hard, and Sir William Eden, Bart., who sends a number of sketches, has spoiled his drawing of the "Temple of Dendera" by the crooked column on the right. William Affleck in "June Roses" and "Gorgeous Flowerets" are careful studies of rustic maidens in fields, with banks of wild roses and flowering grass (83 and 86).

The best work of the president, Mr. Walter Severn, who has four views of scenery, is "River Doon below Burns's Cottage" (125), a tranquil view of a charming spot. His large hilly landscape "Inverary in Autumn," with trees in bright autumn tint of gold and red (97), is a delightful scene; but the trees have a mannered look, and his smooth, reflecting rippled surfaces are a little too placid. A nice boat sketch is by Hely Smith (101). A very charming study of an old woman, "A Lace Maker" (104), by Mary A. Sloane, rich in tone and colour, is one of the few subject pictures of merit; and for its religious fervour, Miss Lucy Miller's "The Evening Prayer," peasant girls kneeling before a Crucifix in a harvest field, may be noted; and we notice further on some sunset studies by L. Burleigh Bruhl (105 and 106).

Nice tone in pearly hues is seen in F. Jas. Aldridge's "Summer Weather on the Thames." One of the few subject-pictures of a poetical kind is Lexden L. Pocock's "The Romaine of Margaret" (118), where the "fair lady" is seated by the river side. The drawing and colour are at least satisfactory. The same painter's "Flight of Margaret of Anjou and Prince Edward, 1464" (256), in a dark wood, shows a careful study of costume, and the colour is agreeable. The young prince looks frightened. No. 129, "The Winter Evening," by Maud Peel, a young mother and her child passing along a dark passage by a lighted church is pathetic and well painted, and the same lady's "Golden Autumn" and "Mill in the Cornfield" (159, 160) are clever sketches in warm colour. A nice sketch of "Whitby" (135), by Frances E. Nesbitt, and the river sketches in Oudh, by R. H. Shields, and by Miss Mary Sloane, "Sunset" (157), a study of sky, a "note" of landscape effect, may be noticed in passing. Alice Woodhouse's "West Door, Salisbury" (175), is better in colour than drawing. The drawing of Miss Maude M. Turner (216), a cottage interior, a little girl looking at a picture-book, with a blue jug of daffodils by her side, is pleasing as a colour study. Hebe Alexander's landscape evening effect, blue and golden sunset; N. E. Green's "View at Maggiore" (220), Percy Dixon (229) "Sandy Beach," and Albert Stevens's huge view "Castle of Chillon" (228), with its bank of foliage and rocks and mist-veiled hills, full of light and colour, and his bird's-eye view of "Monaco and Monte Carlo" (236), showing the coast under a veil of haze, is clever. We can only name George Mark's massive foliage and purple heather (247), J. Twigg's bright bit of colour "Madeleine Flower Market, Paris" (240), Miss Mary Steven's brilliant "Old Market," and the same lady's fine "View at Chamouix," a hayfield carpeted with wild flowers, below a mountain range, and some careful drawings by Chas. J. Adams, H. Sylvester Stannard (306); B.J.M. Donne, an Alpine effect, and his "Iris" (371), and other brilliant light and atmosphere studies and sketches, by Miss Margaret Rose (374), C. Duassut, &c. The popular and saleable kind of subjects are those which find favour in this Gallery.

#### ROYAL ARCHITECTURAL MUSEUM.

THE yearly meeting of this Institution took place on Thursday in last week at Tufton-street in the large hall of the Museum. The Duke of Westminster, the President, at the last

moment was unable to preside, being detained at the House of Lords. The chair was occupied in his absence by Mr. John P. Seddon, chairman of the school committee. The hall was well filled by students and their friends, and the proceedings were of a very hearty character. Among the council present were Mr. Aston Webb, A.R.A., Mr. J. H. Pollen, Mr. E. L. Somers Cocks, the treasurer, Mr. Chas. Foster Hayward, Mr. Sidney Lee, Mr. William Pain, the secretary of the School of Art, and Mr. Maurice B. Adams, hon. sec. The following report was adopted, and Sir Arthur Blomfield, A.R.A., was added to the list of vice-presidents. The Duke of Westminster was re-elected president.

The council, in presenting their report for 1898, record the loss of some of the oldest and staunchest supporters of the institution, notably of Mr. Walter Carew Cocks and Professor T. Hayter Lewis, F.S.A.

During the year the new classrooms added to the museum on the south side have been completed, furnished, and occupied, and have been extremely useful.

The results of the examinations held in 1898 were, on the whole, very satisfactory. In 1897 (as was stated in last year's report) the number of candidates from the Westminster School of Art who were presented in the most advanced subject, drawing from the life, was 61, of whom only two failed. It was scarcely to be expected that this remarkable result could be repeated, but in 1898 there were 64 candidates, and again only two failed. To form an adequate estimate of this remarkable success, the local figures are appended in juxtaposition with the results of the whole of the United Kingdom, viz.:-

	Westminster School of Art.	United Kingdom.
Excellent .....	9	92
First class .....	17	192
Second class .....	86	736
Failed .....	2	330
Total candidates .....	64	1,350

It will thus be seen that the failures in this subject were only 1 in 30, as against 1 in 4 for the kingdom generally.

Five "Queen's Prizes" were awarded to students of the Westminster School of Art—viz: John Shopland, bracketed first amongst 1,350 candidates in Drawing from Life. John H. Harnstone and Geoffrey F. Webb, bracketed sixth amongst 1,744 candidates in Drawing from Antique. Gertrude Brodie, placed second amongst 537 candidates in Anatomy. Robt. W. Bousley, bracketed first amongst 627 candidates in Modelling Design (Advanced).

In the National Competition, also, the work sent up from this school of art was more than usually successful. Six students obtained prizes—viz., Albert J. Baker and Frances Drummond, book prizes for drawing from the life; Millicent J. Owen, book prize for a modelled mirror-frame; Edgar G. Vernon, bronze medal for design for a fireplace; James Begg, silver medal for a modelled design for a door-knocker; and Henry J. Strutt, the much-coveted prize of a gold medal for a modelled panel or grille for a music-room. At the request of the Science and Art Department, some of these works were subsequently sent with others to an exhibition at the Royal Industrial Art Museum at Budapest, and thence to Vienna and other places, and ultimately Mr. Strutt's gold medal work was purchased by the Austro-Hungarian Government.

The Council feel that, while these successes redound to the credit of the school, it is but fair to add a word of cordial congratulation to Mr. Mouat Loudan, Mr. J. Holgate, and Mr. F. E. E. Schenck, to whose careful and judicious teaching they are so greatly due.

In conclusion, it is satisfactory to observe that, notwithstanding the heavy and exceptional expenditure of the last two years, the finances of the Institution are in a satisfactory condition.

Sir Wyke Bayliss, P.R.S.B.A., delivered an impassioned and encouraging address to the old students, entitled "The Bogey in the Studio." The lecturer traversed the fallacy of much which passes for criticism in dealing with art questions of the day, and scouted the Bogey embodied in the term of reproach a "pot-boiler," seeing that every serious and honest worker was entitled to labour that he might live. The greatest works of art which the world has ever seen were produced under such conditions, and very often the worker laboured midst the most unlovely surroundings, and worked under great disadvantages, against odds, and in the face of

disparagement. There was the bogey of the common-place, and he urged artists to remember that they should get more into their pictures than they could find in their paint-boxes. All art worthy of the name began in paint and ended in passion. The artist should not only be a seer, but a revealer. Another bogey was the one which would fain persuade a man that he was an artist because he knew something about technique, or had an appreciative mind for the beautiful. True art was, he asserted, the property of no class, age, or people; the birth-right of every true art worker remained, and the pessimist's cry about the age of the decadence was a Bogey, to be seized by the throat and vanquished if ever good work was to be done, as it is done every day by those whose individuality and sense of proportion enable them to kick out such-like Bogeys from their studies and studios.

#### THE ADMINISTRATION OF BUILDING BY-LAWS IN NON-METROPOLITAN DISTRICTS.

A BUSINESS meeting of the Royal Institute of British Architects was held at 9, Conduit-street, W., on Monday evening, to receive and consider the report of the special committee appointed by Council as to the administration of building by-laws in non-metropolitan districts.

Mr. JOHN SLATER, B.A., chairman of the special committee, presided, and moved the adoption of the following report, which he stated had been recommended by the council for approval:—

The Committee have considered the present condition of building by-laws in England outside the County of London, and their administration.

Some of the larger municipalities are governed in these respects under private Acts of Parliament; but the great majority of boroughs and urban districts have adopted by-laws under the Public Health Acts which have been confirmed by the Local Government Board, and they are for the most part founded on, though they do not absolutely follow, the Model By-laws issued by that Board.

Around some of the larger centres of population there are urban districts which have obtained the sanction of the Local Government Board to building by-laws varying in several particulars from the Model By-laws and from one another. This want of uniformity in districts closely adjacent causes inconvenience and irritation to building proprietors as well as to architects.

It is within the powers of rural sanitary authorities to apply for and obtain from the Local Government Board "urban powers," which have been freely granted. They can then adopt the whole of the Model By-laws.

When adopted the By-laws become operative not only in that part of the district which is crowded, but also in its suburbs and outlying districts; and thus a rural district, often extending for miles round the large village or small town which forms its centre, has just the same building regulations as a crowded town.

It is the experience of the Committee that some of the by-laws thus introduced are not well adapted for general use throughout the country, and when applied in connection with ordinary buildings over large areas of a purely rural character, they become oppressive.

The enforcement of unnecessary regulations in respect of matters in which the public has no practical interest seems to the committee an improper interference with the liberty of the subject.

It gives useless trouble to local authorities. It multiplies undesirably officials to be paid out of the rates.

It adds unreasonably to the cost of building. It promotes monotony in design, stultifies invention, and prevents improvement.

It occasionally stops building. More particularly it discourages the erection of cottages for the labouring classes by landed proprietors on their country estates.

Recognising the necessity for such building by-laws as are proved to be essential to the safety or health of the public, and desiring that the by-laws relating to the same subject should, as far as practicable, be alike throughout the country, the Committee suggest that the model by-laws should be grouped in divisions as detailed below, in order that buildings in rural localities may be relieved from those divisions which appear inapplicable in such places. In an Appendix they deal in detail with each division so far as amendment appears to them needed therein.

#### Suggested Divisions.

- Definition of Terms and Exempted Buildings [Model By-laws 1 and 2].
- New Streets [3-8].
- Space about Buildings and Area of Windows [53-58].

- D. Structure of Party Walls [25-32].  
 E. Structure of Walls, Foundations, Roofs, and Chimneys [11-23, 33, 34, 36-52].  
 F. Sanitation, Preparation of Site, and Drainage [9, 10, 17, 52A, 60-89].

In rural districts the Committee consider that A, D, and F would suffice. It might be desirable to add B in the case of any part of a rural district likely to become urban.

Possibly E might be added, to apply only to large public buildings, warehouses, and factories of considerable height. Ordinary shops should not be regarded as other than domestic buildings.

In towns where a competent building surveyor of experience is engaged, the whole of the by-laws should be in force. In such places exemptions from certain divisions of the by-laws should be made applicable to particular buildings rather than to districts. The Committee are of opinion that in no case should the exemptions extend to sanitary matters. The exemptions they suggest are set forth in the Appendix, Division A, No. 2.

It appears to the Committee that no model by-laws can be considered complete which do not include those to be enforced by local authorities with respect to the staircases and exits of public buildings and factories, even though authorised otherwise than under the Public Health Acts.

It is of great importance that the requirements of the local authorities as to the deposit of drawings should be reasonable, and that they should be explicitly stated. The committee suggest that in all cases a block plan, with the lines and depths of drainage shown thereon, together with the nearest public roadway and adjoining premises within 100ft. of the proposed building, should be deposited, and that, where required, plans and sections (together with elevations, if needful to explain methods of construction) should be submitted for inspection during a defined and limited time; which drawings should be then returned, stamped, if approved, or, if not approved, accompanied by a precise statement of the particulars in which the by-laws have not been complied with.

It would be of great advantage if an appeal could be provided to a technical authority as to the meaning and applicability of by-laws.

The Committee have the honour to lay this Report, with the Appendix, before the Council of the Royal Institute of British Architects, and request that it may be submitted to a general meeting.

It might be well to forward copies to the allied societies, for their consideration, before the meeting is called.

On the report being adopted, the Committee suggest that the Institute should request the Local Government Board to receive a deputation, whose objects would be to point out to the Board the desirability of altering some of their Model By-laws and arrange them in divisions, and to request the board to take such steps as may be necessary to bring the new method of administering the by-laws before the notice of the local authorities.

The influence of those who are interested in building would have to be brought to bear upon the local authorities to urge them to give effect to the proposed measures of relief by adopting such, and such only, of the divisions of the by-laws as would be applicable to their districts or to different portions thereof.

#### SYNOPSIS OF MODEL BY-LAWS AS ISSUED BY THE LOCAL GOVERNMENT BOARD.

No.	Division.
1. Interpretation of terms	See Appendix, A.
2. Exemptions	See Appendix, A.
3-6. New streets. Retain	B.
7. New streets	See Appendix, B.
8. New streets. Retain	B.
9, 10, 10A, 10B. Sites. Retain	F.
11, 12. Walls	See Appendix, E.
13-16. Walls. Retain	E.
17. Damp-course	See Appendix, F.
18, 19, 20, 21. Walls	See Appendix, E.
22, 23. Walls. Retain	E.
24. Wood in external walls. Omit	
25-32. Party-walls	See Appendix, D.
33, 34. Support of timbers. Retain	E.
35. Brick nogging. Omit	
36-51. Chimneys, &c. Retain	E.
52. Roofs. Retain	E.
52A, 60A. Water on roofs, &c.	See Appendix, F.
53, 54. Open spaces	See Appendix, C.
55, 57. Windows	See Appendix, C.
Heights of stories. Omit.	
56. Ventilation under floors. Retain	C.
58. Ventilation of rooms. Retain	C.
59. Ventilation of public buildings. Omit.	
60. Subsoil. Retain	F.
61-64. Drainage. Retain	F.
65. Drainage	See Appendix, F.
66-79. Drainage. Retain	F.
80-85. Ashpits. Retain	F.
86-89. Cesspools	See Appendix, F.
91, 92. Notices and plans	See Report.

## APPENDIX.

### DIVISION A.—DEFINITIONS AND EXEMPTIONS.

#### Interpretation of Terms.

#### Model By-laws.

##### No. 1.

Terms defined by the Acts under which the by-laws are made should be inserted here for general information.

"Base" of a wall carried on a bressummer should mean the course above the bressummer. (See London Building Act, 1894.)

"Topmost story" should be defined to include a one-story building.

As far as possible, the interpretations should accord with the London Building Act, 1894.

#### Exempted Buildings.

##### No. 2.

It is undesirable that any buildings should be exempt in practice from supervision respecting sanitation and drainage; certainly not railway stations.

##### No. 2.

##### (h)(i)(j).

To be substituted for Model By-law No. 2 (h) (i) (j). The following buildings to be exempted from all by-laws excepting Division F (sanitation, &c.)

(h) Any building, not being a public building or factory (or which being a public building or factory is one story only in height and is without any gallery), which is situated not less than 15ft. from the boundary of the curtilage thereof.

For the purposes of this by-law two domestic buildings shall be regarded as one building provided they are separated by a party-wall in accordance with Division D.

NOTE.—This is not intended to exempt any public building or factory from by-laws regulating exits and stairs, should such by-laws be introduced.

(i) Any building situated within 15ft. of the boundary of the curtilage, which is distant 15ft. at the least from any public way and from any other building within the curtilage, and does not exceed 60ft. super. in area, nor 15ft. in height, provided that its external or party-wall towards the boundary of the curtilage is constructed as provided for a party-wall in Division D.

(j) Greenhouses if not attached to other buildings (see London Building Act).

(k) Greenhouses attached to other buildings so far as regards the necessary woodwork of their sashes, skylights, doors, and frames.

### DIVISION B.

No. 7 (c). Suggested amendment:—He shall construct on one side at least of such street a footway not less than 6ft. wide.

### DIVISION C.

No. 53. Omit 53 in favour of 53A.

No. 54. Add to 54 and its proviso Section 41 London Building Act, Subsection i., modified thus:—

Where there is a basement story directly and sufficiently lighted and ventilated, or where the basement story is not constructed or adapted to be inhabited, or where there is no basement story, and where the ground story is not constructed or adapted to be inhabited, the open space required by this section may be provided above the level of the ceiling of the ground story or a level of 16ft. exclusive of lantern lights, measured from the level of the adjoining pavement.

Section 52 of the London Building Act should also be introduced in the following form:—

In the case of domestic buildings and stables or other dependent buildings abutting in the front upon a street and in the rear upon a mews or public way, the sufficient open space provided for the domestic building shall serve also for the stables or dependent building.

It might be desirable to introduce Section 45 London Building Act respecting "Courts within a building."

No. 55. Suggested amendment: Every person shall construct . . . suitable windows in such manner that effectual means of ventilation by direct communication with the open air shall be

provided for every habitable room of such building.

NOTE.—It is not desirable that the heights of stories should be arbitrarily fixed by By-laws.

### DIVISION D.—PARTY-WALLS.

#### Model By-laws.

Such parts Every wall built for the separation of Nos. 19, of adjoining buildings belonging to 20, 21, and different owners or occupied or adapted 22 as relate to be occupied by different persons to party- shall be constructed of good bricks, walls, and stone, or other hard and fire-resisting Nos. 26, 27, material, properly bonded and solidly 28, 29, 30, put together with good mortar. 31, and 32.

Such wall shall in no part be less than 8½ in. in thickness. It may, however, be divided into two thicknesses of 4½ in. by a flue, provided that such flue be pargetted and has an opening into one only of the adjoining premises.

Such wall shall extend from the foundations or footings up to the underside of the incombustible roof covering, and shall be built or properly corbelled out to the full extent of any projecting string, eaves, or other architectural feature any part of which within 3ft. of the party-wall is constructed of wood or other combustible material.

It shall also be carried up the full width and height of any turret, dormer, lantern light, or other erection on a roof or flat any part of which within 4ft. of the party-wall is constructed of wood or other combustible material.

No timber shall be built into or placed in any party-wall nearer than 4½ in. to the centre line thereof, nor within 9 in. of the inside of any flue or chimney opening, nor within 7 in. of the hearth; nor shall any wooden plug be driven into any such wall nearer than 6 in. to the inside of any flue or chimney opening.

Such wall shall in each of the following cases be carried up above the roof or flat or gutter of the highest building adjoining thereto to such height as will give a distance of at least 15 in., measured at right angles to the slope of the roof, or above the highest part of any flat or gutter, as the case may be, and shall be properly coped and protected from water soaking into the wall:—

(a) When either of the adjoining buildings has a roof not externally covered with slates, tiles, metal, or other incombustible material;

(b) When either of the adjoining buildings exceeds 30ft. in height, measured from the lowest part of the ground-floor story to the tie of the roof, or to half-way up the gable if the roof has no tie;

(c) When either of the adjoining buildings is intended or adapted to be used as a public building or as a warehouse, factory, or workshop.

When either of the adjoining buildings is of the class described under (c) and exceeds the dimensions described in (b), the wall shall be carried up for a distance of 36 in. above the roof, flat, or gutter, as the case may be, and shall also extend 12 in. higher and wider on each side of any turret, dormer, lantern light, or other erection on a roof or flat any part of which within 4ft. of the party-wall is constructed of wood or other combustible material.

#### Buildings Adjacent to the Boundary of the Curtilage Thereof.

No. 25. When the external wall of a new building is within 7ft. 6 in. of any boundary of the curtilage other than a public road, the wall shall be built of incombustible material, and no timber or other combustible material shall be fixed beyond the face of such wall.

### DIVISION E.—STRUCTURE OF WALLS, ETC.

#### Model By-laws.

##### No. 11.

Add:—Any story in a roof, and the story immediately below the roof not being the ground story of a detached or semi-detached domestic building, may be inclosed with timber studding, not less than 4 in. thick, properly framed, covered externally with weather-tiling or plastering, and internally with plaster-work covering the whole surface excepting the neces-

sary openings. Such inclosure, when properly corbelled out, may overhang the wall below, provided the soffit be plastered.

No. 18 (iii.) Add to 18' (iii.) :—A pier not less in width and breadth than twice the thickness of the wall as defined for each story, and standing on a solid foundation, shall be deemed to be a return wall for the purposes of measuring the length of walls.

Nos. 19 & 20. Omit "and every party-wall," and add in both cases :—The minimum thickness of every party-wall shall be 4½ in. less than that prescribed for an external wall of corresponding height and length, but in no case less than 8½ in.

Add to 19 (not 20) :—Where the wall of any domestic building, hereby required to be 13½ in. or more in thickness, is covered externally with tiles or other similar incombustible and impervious material securely fastened thereto, the said thickness may be reduced by 4½ in., provided that such reduction shall not be made on more than one story nor on any ground story nor on any story exceeding 10ft. in clear height.

No. 24. Omit 24. See sec. 55, London Building Act, 1894.

No. 35. Omit. There is no corresponding rule in the London Building Act, 1894.

No. 52A. Omit. See Division F, substituted By-law.

#### DIVISION F.—SANITATION, PREPARATION OF SITE, DRAINAGE.

##### Model By-laws.

No. 17. Substitute "floor" for "timbers" in line 5. In the second paragraph a vertical damp-course should be substituted for the hollow wall described.

Nos. 52A. and 60A. Substitute the following :—Every person who shall erect a new building shall make suitable provision for carrying off the rain-water from the roofs, flats, gutters, and areas in such manner as not to cause dampness in any part of the walls or foundations of such building or any adjoining building.

No. 65. It should be made to appear that this applies only to foul drains.

Nos. 86 to 89. The provisions respecting cesspools are impractical and unsatisfactory. The question of the disposal of sewage where no sewers are available requires reconsideration under modern conditions.

Mr. LACY W. RIDGE seconded the adoption of the report. He remarked that they could hardly expect its recommendation to be received with absolute unanimity, and still less that the Local Government Board should adopt it in its entirety; nevertheless, it had been very carefully drawn up, the main principles governing its drafting being that all by-laws should be as uniform as possible, and that they should not be enforced where no public necessity existed, as, for example, in buildings erected in the open country.

Mr. WILLIAM WOODWARD, while eulogising the report as a whole as the best that had ever emanated from any committee of the Institute, said it would be a mistake to make the provisions of the proposed by-laws too lax. As for giving exemption to buildings erected in the open country, suggested by Mr. Ridge, they must remember that what to-day was an unoccupied field in a few years time would be absorbed in a crowded town, and they must, therefore, look ahead. There should be an appeal from the district councils to a technical building tribunal, such as existed under the London Building Act of 1894. An excellent feature in the recommendations was that no definite scale was laid down for the block-plan, plans, and sections; but he thought the requirement that on the block-plan should be shown the "adjoining premises within 100ft. of the proposed building" was needlessly comprehensive, and he moved that these words be omitted.

Mr. E. W. HUDSON differed from Mr. Woodward as to this last point; it was often, in country districts, necessary to show existing premises 100ft. from the proposed building in order to fix a frontage line.

Mr. P. GORDON SMITH, architect to the Local Government Board, said the recommendations in the report had, as a whole, his sympathies; but the subject was full of difficulties, as it opened up certain defects in the general legislation by which they were all controlled. Under the existing law, rural district councils could apply

to the Local Government Board for sanction to exercise urban powers, and the Board would feel a very grave responsibility was incurred by refusing to allow to any local authority such powers if definitely asked for. (General cries of dissent.) So far as he was personally concerned, he would do all in his power to bring about the modifications named in the report, although certain propositions were very debatable.

Mr. RALPH NEVILL, F.S.A., could not agree with Mr. Gordon Smith in his views as to the attitude that should be adopted by the Local Government Board towards rural district councils, as he felt that such bodies should be discouraged from attempting to assume too much authority. In designing cottages for erection in various parts of Surrey and Sussex, he had been much hampered by rural district councils, who enforced unreasonable rules—e.g., as to the height of rooms, the thicknesses of walls when a room was built in a gable, and the proportion of room space to windows; they often insisted on footings to walls where the whole structure stood on a solid 12in. bed of concrete. He should have liked to have criticised and sought to amend many details in the report, but feared it was now too late.

Professor KERR said a hard and fast cast-iron insistence on compliance with the letter of the law only irritated building owners, their architects and builders. The aim should be to enforce the principle rather than the letter of the building by-laws.

Mr. LACY RIDGE said there was great difficulty in interpreting the London Building Act, and they might imagine how much more diverse would be the readings of by-laws by rural councils. He could not agree with Mr. Gordon Smith's views of the compliant attitude the Local Government Board should adopt towards rural councils who sought urban powers.

Mr. WOODWARD's motion having found no second, the Chairman formally moved that the report be received and adopted, and this was unanimously agreed to.

#### PROCEDURE AS TO PARTY STRUCTURES

The CHAIRMAN moved, in accordance with the recommendations of the Special Committee :—

That the Royal Institute of British Architects petition the Local Government Board to promote a Bill in Parliament to regulate the procedure in dealing with party structures in a similar manner to the London Building Act, 1894, in all parts of England where there are no Acts of Parliament dealing with such party structures.

This was seconded by Professor KERR, who said the section of the London Building Act relating to this point had been most useful, and had obviated much litigation, irritation, delay, and expense.

The resolution was spoken to by Messrs. RIDGE, WOODWARD, S. FLINT CLARKSON, and others, and was carried unanimously.

On the motion of Mr. J. M. BRYDON, seconded by Mr. E. W. MOUNTFORD, it was agreed to send an address of congratulation to the hon. associate, Sir L. Alma Tadema, R.A., on the Knighthood just conferred upon him, reference being made to the service rendered the Institute by Sir Lawrence on the Art Committee.

#### PROJECTED METROPOLITAN IMPROVEMENTS FOR NEXT SESSION.

THE improvements committee of the London County Council recommends to the Council six improvements to be undertaken in the ensuing year, three of which—for the extension of the Thames Embankment and the improvement of the Millbank district, the widening of Mare-street, Hackney, and the widening of Goswell-road—are of considerable magnitude. The estimated cost of the improvements, including contributions from local authorities, is £1,565,000.

The first scheme deals with the extension of the Thames Embankment between the Houses of Parliament and Lambeth Bridge and the improvement of the district near Millbank. It is proposed that the course of Abingdon-street and Millbank-street shall be altered, that the new street 70ft. wide shall start from a point which will involve the demolition of the corner house of Old Palace-yard and run thence diagonally to a point much nearer the end of Lambeth Bridge than at present. It is proposed further to purchase all the property between this line and the river on the one side and between it and the west of St. John's Church on the

other side, to lay out the land between Millbank-street and the river as an addition to the Victoria Tower Garden, and to lay out in a manner suitable for offices and residential houses, and with widened streets, the land between Millbank-street and St. John's Church. By the recoupment resulting from the alteration of the line of Millbank-street and from the acquisition of the property between the street and St. John's Church, it will, in the opinion of the committee, be possible to effect this great improvement—to embank the river, to lay out the garden, to widen Millbank-street, and to widen the other streets up to St. John's Church, including a portion of Horseferry-road—at a cost of £530,000, as compared with £306,000 required for an imperfect and unsatisfactory scheme of merely widening the existing Millbank-street, and £498,000 for both widening and straightening the street. This estimate of £530,000 does not include the cost of altering the Abingdon-street block, which is not absolutely essential to the main part of the scheme. If carried out by the Council, it is estimated that the net cost would be £130,300. The committee propose to leave this part of the scheme to be undertaken by the Government, and to confine their specific proposals to the widening of Millbank-street and the embanking of the river. It is estimated that the purchase of property would involve an expenditure of £1,329,000, and the value of the recoupment would be £873,000, leaving the net cost £456,000, to which must be added about £74,000 for the cost of the works, making a total of £530,000. They accordingly recommend the Council to sanction application being made to Parliament for power to carry out the scheme, subject to the Government's agreeing to undertake the Abingdon-street portion of the scheme, and to a contribution of £100,000 from the Westminster vestry. The cost of rehousing the persons who would be displaced by this scheme is estimated at £50,000.

The second scheme is for widening Mare-street, Hackney, to 70ft. between the North London Railway and the Triangle. The total net cost of this scheme is £577,100, and it is recommended subject to a contribution from the Hackney Vestry of not more than £125,000. The vestry have already offered to contribute this sum. The third scheme proposes to widen Goswell-road to 60ft. between Upper Ashby-street and Great Sutton-street at a net cost of £209,500. It is only to be undertaken if the vestries of St. Luke and Clerkenwell contribute between them the sum of £20,000 towards the cost. The fourth improvement is a widening of Nine Elms-lane to a maximum of 60ft. between Southampton-street West and Battersea Park-road. The net cost of this scheme is £136,400, to which the Battersea Vestry are to contribute £15,000. The fifth project deals with the Camberwell New-road, which is to be widened between Warner-road and Camberwell Green at a net cost of £52,000, towards which the Camberwell vestry are to contribute £5,000. The last improvement is a small widening in the Kentish Town-road.

It is proposed to hold Provincial Meetings of the Society of Architects at Sheffield, and possibly other provincial centres, towards the end of June, with a view to bringing forward the question of the Architects' Registration Bill, and also matters affecting the state of the law in regard to "light and air" cases.

The Batley Town Council received, on Friday, a report from the General Purposes Committee recommending the adoption of plans, prepared by Messrs. W. Hanstock and Son, for a new town-hall, to be erected on the Market Estate; and also asked the council to instruct the town clerk to apply to the Local Government Board for sanction to borrow £35,000 for the erection of the building. The recommendations were unanimously adopted.

Under Part II. of the Housing Act, the vestry of Rotherhithe are about to clear a noted insanitary district in the parish, bounded by Rotherhithe, Paradise, and Fulford streets, and Seven Sisters-alley, and including some half-dozen streets and courts near the river. The area of an acre and a half now accommodates 550 people, and the new dwellings will house 890 people. Mr. Service has prepared the plans, and the outlay will be £29,120.

The City Corporation have approved of a proposal submitted by the Improvements and Finance Committee for widening Mansell-street to 50ft. in continuation of the scheme for improving the northern approaches to the Tower Bridge. The estimated cost of the improvement is £61,200.

SELECTED DESIGN FOR THE NEW BOARD OF GUARDIANS' OFFICES, WANDSWORTH—"HILLINGTON," WALTON-ON-THAMES—SCHOOLS OF THE HOLY ROOD, SWINDON—NEW BUILDINGS, NEW COLLEGE, OXFORD—THE PASSMORE EDWARDS CONVALESCENT HOME FOR RAILWAY MEN AT BELTINGE—ST. LUKE'S CHURCH, MUNICH.

## Our Illustrations.

## WANDSWORTH BOARD ROOM AND OFFICES.

We publish herewith some of the plans and elevations that were accepted in the recent competition. Being placed first, as we mentioned in our last week's issue, the author, Mr. Cecil A. Sharp, A.R.I.B.A., of 59, Fenchurch-street, E.C., and also late of Newcastle-on-Tyne, received the first premium of £100, and has been appointed by the guardians to carry out the work. The building is of the Renaissance style of architecture, and will be executed in a very substantial way. The materials proposed to be used are red brick and stone externally, with green slated roofs. The floors will be of a fireproof construction. The halls, corridors, &c., will be finished with flooring of mosaic paving, the walls cement-faced above a dado of glazed brickwork, the ceilings will be panelled out in asbestos plaster. The various offices will be finished and fitted up in a suitable manner for the purpose for which they are intended to be used. It is possible that electric light may be fitted throughout the building in addition to gas; and there will also be an electrical system of ventilation, the plant for which, together with the hot-water warming apparatus, will be placed in the basement. A complete system of telephones will connect all the offices. The sanitary arrangements have been most carefully planned. The building provides upon the ground floor a suit of clerks' offices, accountants', assistant relief officer for school cases, general, and settlement and inquiry. Strong-rooms, lavatories for officials, also for guardians, are approached by a broad corridor and grand entrance-hall, and staircase to the first floor. At the rear is placed the relief committee-rooms, which necessitated a most carefully considered plan to meet the guardians' requirements. It will be observed by reference to the plan that the applicants for relief enter from East-hill direct to their waiting-rooms, and that they enter the committee-rooms direct from waiting-room and again leave by a different door. Also it will be seen that no corridors whatever are traversed by the applicants, and they do not enter any other part of the building except that allotted for their use. The first floor is occupied by offices for the registrar and collector, spare offices and strong-rooms, lavatories, &c. There will be upon this floor a well-proportioned and commodious board-room overlooking Wandsworth Common, being approached by a spacious hall and corridor; upon the east side of board-room is a committee-room and ladies' cloakroom; upon the west side a gentlemen's cloakroom and ante-room. A separate staircase has been provided for the public, who will occupy a convenient gallery, where

also provision is made for the Press. This staircase also leads to the caretaker's quarters above. In the basement strong-rooms, store-rooms for books and papers, coal-cellars, kitchen and boiler rooms, and electrical-plant rooms are provided. The architect's estimate for this work is £20,311.

## "HILLINGTON."

(See description and sketch plans on page 827.)

## THE HOLY ROOD SCHOOLS AND HALL, SWINDON.

THIS block of buildings is now being erected by Messrs. J. Long and Sons, of Bath, from designs by Messrs. Silcock and Reay. The school building contains three classrooms for boys, girls, and infants, each capable of accommodating 40 children, and in addition there are three spacious cloakrooms and a teachers' room, etc. A wide corridor runs the whole length of the classrooms and connects the school with the hall, in which, on occasion, a class of 60 children may be taught. The interior of the hall consists of timber framing filled in with sand-faced bricks to a height of 11ft., above which are the windows. Features of the room are the decorative plaster panels, which are modelled in low relief and slightly wiped with colour. The walls of the classrooms, etc., are lined throughout with brown salt-glazed bricks to a height of 5ft., above which they are plastered. The floors of the classrooms and hall, as well as the galleries, are all of pitch-pine blocks, the corridor and cloak-rooms being tiled. The ceiling joists are exposed and stained dark brown. The walling is of sand-faced bricks and Bath stone dressings. The windows are glazed with lead lights, and the roof covered with green slates. Special provision has been made for efficient ventilation, and the building will be heated with radiators. The latrines, which are of the latest pattern, are situated on one side of the playground.

## NEW BUILDINGS, NEW COLLEGE, OXFORD.

THE elevational drawing which we illustrate is now at the Royal Academy, showing the Memorial Tower to the late Alfred Robinson, M.A., Fellow and Bursar of New College, Oxford. Mr. Basil Champneys is the architect, and at the same time this work was carried out new staircases were added, thus completing that portion of the college buildings. Messrs. Benfield and Loxley were the builders, and Mr. W. Simpson acted as clerk of the works. Chipsam stone was employed.

## PASSMORE EDWARDS CONVALESCENT HOME FOR RAILWAY MEN, HERNE BAY.

THE site of this building adjoins that of the Passmore Edwards Home for Friendly Societies on the Beltinge Estate, on the cliffs east of the town of Herne Bay, and is about a quarter of a mile in a direct line from the sea. It is  $3\frac{1}{2}$  acres in extent, with a frontage of over 300ft. to the road to Reculvers, where it branches from that to Margate. The building will be three stories in height, and contain accommodation for fifty patients, and is so arranged that a further fifty beds can be provided for in the future at comparatively small cost and without difficulty. On the ground floor the entrance-porch leads to a large hall communicating with the main corridor. This corridor gives access respectively to the kitchen and administrative department on the left hand and the patients' rooms on the right. The day accommodation comprises a large general sitting-room and a smaller smoking and bagatelle room, both with south-east aspects overlooking the gardens in the rear. In front of these rooms is a small reading or "quiet" room, fitted as a library, with a large bay overlooking the front garden. Adjoining is a large lavatory, fitted with wash-hand basins and patients' lockers, hat and coat racks, &c., and beyond this latrines for day use. Open verandahs are provided both back and front for the use of the patients. Adjoining the bagatelle room is a dormitory of seven beds for cripples and others whose infirmities render ascending a staircase difficult. Leading directly out of the entrance-hall are the matron's sitting-room and office or waiting-room (both looking on the front), and the large general dining-hall. The last-mentioned is 40ft. long by 21ft. wide, and well lighted at end and sides. A platform will be provided in the centre of one side, so that it can be used for concerts and entertainments. A "stage door" gives access to the platform from the adjoining dormitory. To the left of the dining-hall are the kitchen and scullery, stores, washhouse, coal cellars, &c., and the service

staircase leading to the upper floors. On the first floor are five dormitories, respectively for 11, 9, 7, 6, and 3 beds each. On the second floor, and partly in the roof, is another dormitory for 7 beds, but space is provided on this floor for the accommodation of another 16 or 17 beds when required, at comparatively small additional cost. The officers' and servants' bedrooms, linen-room, &c., are placed over the kitchen block. All dormitories allow at least 750c.ft. to each patient. In addition to day-room accommodation on the ground floor, a small spiral staircase leads from the top floor up to an octagonal room in the tower, rising from the main entrance. This will have windows all round above the level of the roofs, thus commanding extensive and beautiful views on all sides. The external facings are to be in Canterbury red bricks, relieved with Monk's Park Bath stone dressings and hanging tiles. The roofs will be covered with Broseley red tiles. The walls internally will be plastered, all day-rooms and corridors having a cement dado. The dining-hall will have a tile dado all round, and the corridors are to be paved with glass mosaic. It has been sought in the elevation of the building, no less than in the grouping of the rooms, to avoid the idea of an "institution" as opposed to a "home." The cost of the building, including fencing and drainage of the land, will be about £7,500. The architect is Mr. A. Saxon Snell.

## ST. LUKE'S CHURCH, MUNICH.

THIS completes our illustrations of this church, of which we gave exterior and interior views and a full description in our issue of May 12, and a cross-section, looking west, and plan the following week.

## CHIPS.

Foundation stones were laid last week of a new Wesleyan Chapel at Rothwell, Northamptonshire. The chapel is 60ft. by 34ft., will be faced with Weldon stone, and will cost £2,000. Messrs. Gutch and Saunders, of Kettering, are the architects, and Mr. F. Barlow, J.P., is the builder.

A new cemetery is about to be laid out at Work-sop, from plans by Mr. F. S. Whittell, the surveyor to the urban district council. The land, 16 acres in extent, adjoins the Retford-road, and the chapel will be Early English in style, and built of stone.

A special service has been held in Consett Parish Church, when two stained-glass windows, affixed in the chancel in memory of the Rev. F. Steggall, for 35 years vicar of Consett, were dedicated. The windows, which have been designed and executed by Mr. A. O. Hemming, of London, illustrating the subjects "Feeding the Hungry" and "Nursing the Sick."

At Ley, in the parish of St. Neot's, Cornwall, a new mission church was dedicated last week. It is seated for about 100 persons, and has a floor of Venetian mosaic in the nave, and of Roman mosaic in the chancel. The architect is Mr. T. H. Andrew.

At the thirteenth annual meeting in connection with Mansfield College, Oxford, a portrait was unveiled of the first principal of the college, which represents Dr. Fairbairn sitting in an armchair, with a large open book in his hand. It has been painted for the subscribers by Sir George Reid, President of the Royal Scottish Academy.

The Board of Trade have confirmed an order authorising the construction of light railways in the county of Lancaster in the parishes of Barton-upon-Irwell and Stretford, and from Colwyn Bay to Llandudno in the counties of Denbigh and Carnarvon.

The Technical Education Board of the London County Council will open two new domestic economy schools for girls next session, one situated in the north of London and the other in the south. The former will be in connection with the Northern Polytechnic in Holloway, where a new block of buildings has been recently erected, devoted entirely to the teaching of domestic economy. The other school will be situated in Creek-road, Deptford, and will be under the management of the Deptford Fund House Committee.

A mission church of the Holy Cross, built in Woodbury-lane, Axminster, was opened last week. It is seated for 170 persons, and has been built by Mr. Cloud, of Axminster.

The Chancellor of Lincoln Diocese has granted a faculty for the restoration of Anwick Parish Church in three sections. Upwards of £560 has already been promised, and the contract of Mr. F. Pattinson, of Ruskington, has been accepted for the first stage of the work—i.e., the extension of the chancel to its original length and the raising of the chancel roof to its original height.

## ELECTION OF PRESIDENT AND COUNCIL.

AT the Institute meeting of Monday, 12th inst., reported on p. 804, the Council for the year of office 1899-1900 were declared duly elected as follows:—

President: William Emerson.  
Vice-Presidents: John McKean Brydon, William Milner Fawcett, M.A.Cantab., F.S.A., Henry Louis Florence, Edward Augustus Gruning.  
Hon. Secretary: Alexander Graham, F.S.A.  
Members of Council: Frank Thomas Baggallay, Thomas Blashill, James Brooks (Past Vice-President), John James Burnet, A.R.S.A. (Glasgow), William Douglas Carie, M.A.Cantab., F.S.A., Thomas Edward Colclutt, John Alfred Gotch, F.S.A. (Kettering), Edwin Thomas Hall, Henry Thomas Hare, Edward William Mountford, Beresford Pite, John Slater, B.A.Lond., Richard Phené Spiers, F.S.A., Henry Heathcote Statham, Leonard Stokes, Sir John Taylor, K.C.B., Paul Waterhouse, M.A.Oxon., Aston Webb, A.R.A., F.S.A. (Past Vice-President).  
Associate-Members of Council: James Sivewright Gibson, Henry Vaughan Lanchester.  
Representatives of Allied Societies: David Barclay (Glasgow Institute of Architects), Robert Isaac Bennett (Manchester Society of Architects), James Crocker (Devon and Exeter Architectural Society), Thomas Drew, R.H.A. (Royal Institute of the Architects of Ireland), Robert Evans (Nottingham Architectural Society), Charles Busted Fowler (Cardiff, South Wales, and Monmouthshire Architects' Society), William Glover (Northern Architectural Association), Albert Edwin Sawday (Leicester and Leicestershire Society of Architects), Joseph Smith (Sheffield Society of Architects).  
Representative of the Architectural Association (London): George Halford Fellowes Pryne.

## THE STANDING COMMITTEES.

At the same meeting the following members were declared duly elected to serve on the Standing Committees for the ensuing year of office:—

### ART STANDING COMMITTEE.

Fellows: John MacVicar Anderson, F.R.S.E., James Brooks, John McKean Brydon, William Douglas Carie, M.A., F.S.A., Ernest George, Henry Thomas Hare, Edward William Mountford, Henry Heathcote Statham, Alfred Waterhouse, R.A., LL.D., William Young.  
Associates: Robert Shekleton Balfour, James Sivewright Gibson, Henry Vaughan Lanchester, Andrew Noble Prentice, William Henry Romaine-Walker, John William Simpson.

### LITERATURE STANDING COMMITTEE.

Fellows: John Bilson, Henry Louis Florence, Alexander Graham, F.S.A., Benjamin Ingelow, John Tavenor Perry, William Alfred Pite, Sydney Smirke, Richard Phené Spiers, F.S.A., Henry Heathcote Statham, Paul Waterhouse, M.A.Oxon.  
Associates: Arthur Smyth Flower, M.A.Oxon., F.S.A., John Humphreys Jones, B.A.Lond., Andrew Noble Prentice, Ravenscroft Elsey Smith, Leslie Waterhouse, M.A.Cantab., Percy Scott Worthington, M.A.Oxon.

### PRACTICE STANDING COMMITTEE.

Fellows: Thomas Batterbury, Samuel Flint Clarkson, Thomas Harris, George Hubbard, Alexander Henry Kersey, Joseph Douglas Mathews, Walter Hilton Nash, Beresford Pite, James Osborne Smith, Edmund Woodthorpe, M.A.Oxon.  
Associates: William H. Atkin-Berry, Charles Henry Brodie, Herbert Hardwicke Langston, Sydney Perks, Augustus William Tanner, William Henry White.

### SCIENCE STANDING COMMITTEE.

Fellows: Lewis Angell, M.Inst.C.E., Delissa Joseph, Hampden William Pratt, John Salmon Quilter, Herbert Duncan Seales-Wood, Percival Gordon Smith, Alfred Saxon Snell, Lewis Solomon, William Charles Street, Benjamin Tabberer.  
Associates: Sydney Benjamin Beale, Henry William Burrows, Max Clarke, Bernard John Dicksee, Matthew Garbutt, Assoc.M.Inst.C.E., Charles Henman.

The hon. auditors for the past official year, Messrs. Zeph. King and Frederick William Marks, were re-elected for the ensuing year.

## MR. HAL HURST'S EXHIBITION.

AT the Modern Gallery, 175, Bond-street, a series of clever figure-studies and sketches by Mr. Hal Hurst is on view. These are in oils, water-colours, pastels, silver-point, and black-and-white sketches. The subjects are slight sketches in pen and washes of bright tints of girls in fashionable costumes and evening dress under various diverting moods, coquettish young maidens of "the period," or of the "Gay Parisienne" type, in shimmering silks on drawing-room lounges, ball-rooms, race meetings, swinging in hammocks, or by the seaside. There is much delicacy of line and grace in Mr. Hal Hurst's sketches, which are thoroughly French in style; even the mounts of many are in the Louis Seize style. A few subjects in black and white are very clever in drawing and grouping. "The Last Resource," a poor widow pawning her ring, three children under her charge; and "Down in Trafalgar Square," a group of crouching humanity who have been sleeping under the shelter of one of the bronze lions, one disconsolate pair with children walking away, are touching subjects. At the other extreme of society we have a clever drawing of "The Coaching Club Meet," a fashionable throng of ladies and gentlemen, and "The Lawn, Ascot," a scene on the course, and some others. A few of the works give evidence of a more serious and solid treatment, as a landscape evening effect. Some of the decorative designs in outline and colour for panels are clever.

## THE DISPUTE IN THE BUILDING TRADE.

THE result of the Conference of Unions held at Manchester on Monday proves that there is no controversy between the men and the masters. The master builders recently held a conference in London with the plasterers under an independent chairman, and agreed on certain terms. These terms they proposed to the combined unions as the basis of a combined conference, for which they also suggested the same chairman. The combined unions, through their representatives, rejected this basis, their main ground of objection being that the terms contained, or conveyed, certain allegations as to the practices of their unions which they repudiated as unfounded. Evidently it was not so much a question of substance as of form upon which disagreement arose. The effect of Monday's conference at Manchester has been the proposal of a representative constitution for the building trades similar to that which was created in the engineering industry at the close of the great dispute in 1898. The men suggest the formation of joint each district, to deal with any differences or disputes that may arise in the district with an appeal to a national conciliation committee of employers and employed for board representing the whole industry. This proposal merely generalises the plan contained in the plasterers' agreement for the settlement of demarcation disputes, and we do not suppose the master builders will object to it. Our opinion is that such a "constitution" is the best, indeed the only trustworthy instrument for dealing with the troubles of the building trades and other industries. The only point left to fight about at present is a question of fact. Are the unions guilty of encouraging or conniving at certain practices, such as compelling foremen to join them, refusing to work with non-unionists, and so forth? One side will continue to say that these are isolated instances, while the other will repeat that they are general practices. The only way of dealing with allegations of this kind is to take each case as it arises, and refer it to a tribunal to be dealt with on its merits. It is, of course, always difficult to arrange a peace while war is being actively waged, and at present war is unfortunately being waged in most of the Yorkshire districts. The Yorkshire employers have explained that they offered to withdraw the lock-out if the conference were arranged on the terms proposed; but this does not alter the fact that their action has been taken independently of the National Association, and that it may seriously prejudice the success of the general agreement which that Association desires. The Yorkshire employers will probably recognise that the proposed basis will make room for an adjustment of the questions in which they are principally interested. Their present action imports an element of weakness into the employers' organisation, while it also makes against the chances of a peaceable discussion of differences. That workmen need to be beaten into reasonableness is a view with which we have no sympathy. What they want is to be taught to distinguish between their real interests as a class and the petty animosities and sectional rivalries which sometimes run away with them. They will learn this best not by being starved into a temporary surrender, but by having constantly to argue their claims and complaints before a competent tribunal composed in part of men of their own trade, and having to make good their case in the eyes of those who have the stability of the trade as a whole to consider. Strikes and lock-outs are war, and all war is wasteful. Arbitration is the one way out. The master builders and their men will find it. That, at any rate, is our belief. We have much too good an opinion of both to dream that they will wait till arbitration in labour disputes is made compulsory, as it ought to be in all industries. The building trades are the pick of the avocations of the people of these

islands, and their leaders and members are bound to maintain their past reputation in this as well as other things.

## OBITUARY.

MR. WILLIAM L. HENDERSON, of the firm of William Henderson and Son, architects, of Aberdeen, died on the 5th inst., from an affection of the heart. He was the eldest son of the late Baillie William Henderson, architect, wood merchant, valuator, &c., who carried on business for many years in Loch-street. Under the title of W. Henderson and Son, the firm carried out a large number of architectural and building contracts both as under the former arrangement when the business was carried on in Loch-street, and in more recent years since the firm's premises were removed to Union-street, and the business more strictly confined to architectural and valuation work. Among the many Free Churches erected by the firm may be mentioned those at Old Aberdeen, Cultra, Torry (old), Gallowgate, Macduff, Ellon, Braemar, Newmachan, Greyfriars, and Rutherford, and they also designed the parish church of Laurencekirk. About the time of the passing of the Education Act the firm were architects for a large number of schools in the north of Scotland, particularly in Orkney and Shetland. In more recent days (and partly while Mr. Alexander Mavor was a partner in the business) the firm were architects for numerous buildings of a public character. These included the Morningfield Hospital, numerous branches for the Union Bank, and the New-hills Cottage Hospital. The firm were architects for the Aberdeenshire County Council, and built a number of police-stations throughout the county, and carried out contracts for many commercial firms in Aberdeen. Mr. Henderson, who was a member of the Aberdeen Society of Architects, had been married twice, but at the time of his death was a widower. He leaves three sons and a daughter.

## CHIPS.

The excavations now being made in the Roman Forum by order of Signor Baccelli, Minister of Public Instruction, have led to the discovery, under the Lapis Niger, in the midst of a number of votive offerings, a cippus of tufa rock, remaining in its proper site, bearing a Latin inscription written in the most ancient Latin characters.

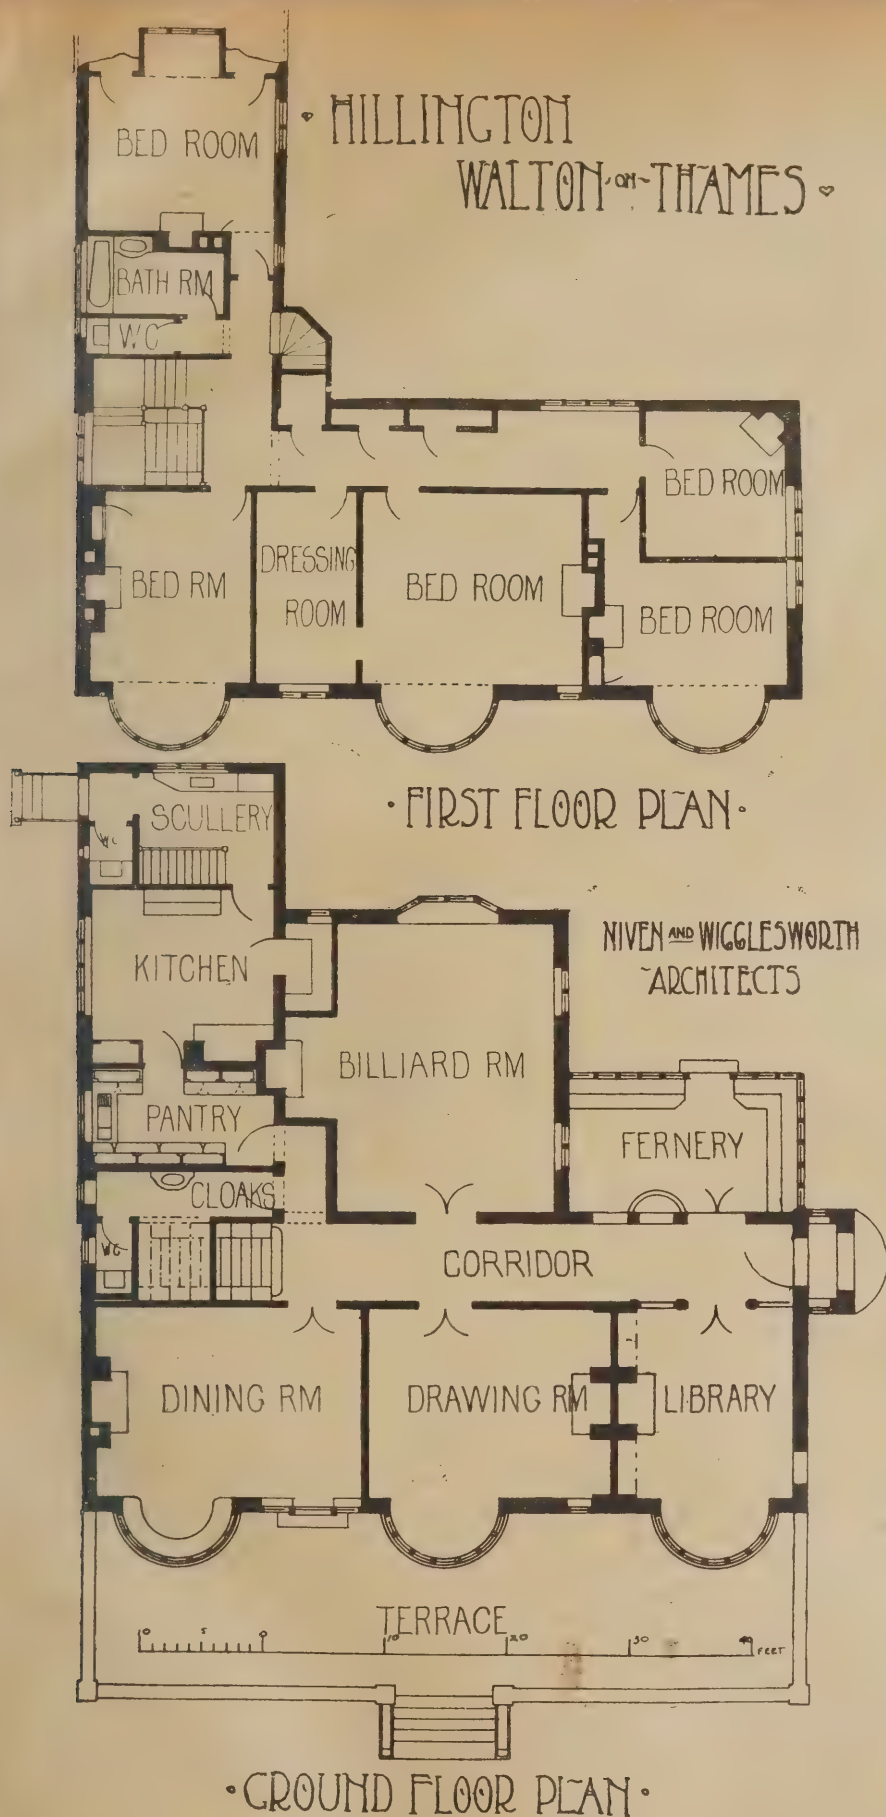

A Select Committee of the House of Commons has passed the preamble of the Harrow and Uxbridge Railway Bill, which provides for the making of a short line to connect the authorised Harrow and Uxbridge Railway with the Metropolitan Railway, so as to provide alternative routes from Uxbridge, the one via the Ealing and South Harrow Railway, now being made, and the District Railway to Victoria, and the other by the Metropolitan Railway to Baker-street and the City.

A new Masonic Lodge for the convenience of professors of the arts of sculpture and painting was consecrated on Tuesday night at Freemasons' Hall, London, by the Grand Secretary of England, Mr. E. Litchworth. The lodge is named the Arts Lodge, and is numbered 2,751 on the roll of Grand Lodge of England. At the conclusion of the ceremony of consecration, Mr. George Simonds, Past Grand Steward, was installed as the lodge's first Worshipful Master, and Mr. Graham G. Nicholas and Mr. Francis J. Short were invested as Wardens. The other offices were bestowed on Messrs. J. Erskine Knox, Thomas Stirling Lee, William S. Frith, C. Harrison Townsend, Francis Bate, Alfred Hartley, H. Harris Brown, and C. J. Harold Cooper.

A mural monument has been erected in St. Botolph's Church, Bishopsgate, to the memory of the Rev. William ("Hang Theology") Rogers, for 33 years rector of the parish. It is of Cipollino marble, from the ancient quarries in Euboea, and of Pentellic marble from the neighbourhood of Athens, and contains a portrait in low relief placed within a wreath, and below this an inscription. Mr. J. F. Bentley, under whose supervision St. Botolph's was restored in the lifetime of Mr. Rogers, designed the memorial, which has been executed by Messrs. Farmer and Brindley, of Westminster Bridge-road.

You want to read George Griffith's new story, "BROTHERS OF THE CHAIN," in the *Weekly Times and Echo*, don't you? Better order that paper for June 18 at once of your newsagent, then, or you may miss the first chapter. You remember the demand for his "Angel of the Revolution," "Olga Romanoff," "The Outlaws of the Air," and "The Romance of the Golden Star," and how you couldn't rest till you got *Pearson's* every week to read them. This is as good as the best of them—some say better.

#### "HILLINGTON," WALTON-ON-THAMES.

THIS illustration, from the current exhibition at the Royal Academy, is of a drawing by Mr. F. L. Griggs, of a house recently erected at Walton-on-Thames, from designs by Messrs. Niven and Wigglesworth. A feature is made of the regular bay window treatment; the bays being enriched by modelled cement, and surmounted by ornamental lead gutters.

#### RENDLE'S "INVINCIBLE" GLAZING.

THE perfected system of glazing introduced some years ago by Messrs. W. E. Rendle and Co., of 5, Victoria-street, Westminster, still remains in high estimation among architects. Every additional application that is made of the system proves its efficacy. The most recent testimonial received by Messrs. Rendle and Co. comes from the architect of the National British

Gallery, Mr. Sidney R. J. Smith, F.R.I.B.A., who is able to give this system the unqualified recommendation that the work done at the Gallery has stood a "most severe test during the recent high gales." No better test can be applied to any system of glazing than this. As our readers acquainted with the "Invincible" system know, the glass is held firmly between a water channel of metal (copper or zinc) fixed to a wooden rafter or steel bar, and a metal cap fixed with screw-bolt and nut, so that there is no vibration or shaking of the glass; the channel and condensation gutters underneath carry away all leakage or condensed moisture, and all the wood or ironwork is covered by the glass. The "Invincible" system has been used over the four great spans of the Liverpool-street Station roof, 493ft. long, also on the roofs of the Moor-gate-street Station, Eastbourne Station, Windsor Station of the G.W.R., the Leicester Station, and numerous other station roofs, the Brighton Baths, the swimming baths of the Northampton Institute, Clerkenwell, and other baths in London, and over numerous other buildings where top lights are required. The Rendle bar allows of squares of glass of 10ft. long. The system is readily applied, durable, and is not affected by heat or cold, or expansion and contraction, as other systems are.

We omitted last week on p. 797 to state that the new lounge at the Opera House at Covent Garden Theatre was glazed by Messrs. W. E. Rendle and Co., on their well-known patent system. Messrs. W. E. Rendle and Co. have also just signed a contract with the London, Brighton, and South Coast Railway for reglazing the whole of the roof at Brighton Station, containing an area of 60,000ft. super., and the greater part of London Bridge Station, containing an area of about 40,000ft. super. Better testimony to the superiority of this well-known system can hardly be desired.

#### PROFESSIONAL AND TRADE SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—The annual business meeting was held in the rooms, 187, Pitt-street, on Tuesday evening, June 6, at 7.30, the president, Mr. Geo. S. Hill, A.R.I.B.A., in the chair. The business of the evening comprised the reading of the secretary's, treasurer's, and librarian's reports, which were adopted, and the election of new office-bearers for the ensuing session. The following gentlemen were elected to office:—President, Mr. John Fairweather, A.R.I.B.A.; vice-presidents, Messrs. Chas. E. Whitelaw and Wm. J. Blain; secretaries, Messrs. Alex. Wingate and Thos. Ramsay; treasurer, Mr. Walter S. Tucker; librarian, Mr. Andrew Rollo; general committee, Messrs. Geo. S. Hill, A.R.I.B.A., Jas. Lochhead, A.R.I.B.A., Alex. McGibbon, A.R.I.B.A., Jas. McKissack, Alex. Davie, Wm. Vickers, Wm. S. Lukeman, and Robert J. Walker. A vote of thanks to the retiring president, Mr. Geo. S. Hill, concluded the business.

Mr. Victor Wilson, of Bacup, has been appointed surveyor to the Wardle Urban District Council from among 37 candidates. Mr. Wilson, who is 25 years of age, has hitherto been engaged as assistant-surveyor to the Atherton Urban District Council.

The Duke and Duchess of York have arranged to open the new homes of the National Society for Employment of Epileptics at Chalfont St. Peter, on Friday, June 23, instead of June 22, as previously announced.

The Leyton Urban District Council, who at first hoped to provide public baths for £8,000, then for £15,000, and thirdly for £23,000, have taken another leap forward and have adopted, though only by the narrow majority of 12 votes to 11, a scheme which is estimated to cost £31,000.

Mr. W. O. E. Meade-King, C.E., held an inquiry at the council chamber, Darlington, on Friday, into an application on the part of the corporation of Darlington for sanction to borrow £30,000 for the purpose of electric lighting, and £591 for the purchase of land in Haughton-road for the extension of the depot.

A syndicate representing some leading City firms has been registered which proposes to erect a new building, to be called the City of London Exchange, as a common rendezvous for the representatives of houses engaged in all branches of commerce. A site has been acquired in Jeffrey-square, St. Mary Axe, near Leadenhall-street, on which it is intended to erect, at a cost of not less than £250,000, a building with an area of 27,500sq.ft.

## COMPETITIONS.

FORFAR.—At a meeting of the Forfar County Council it has been decided to approve of the recommendation of Mr. Morham, assessor, to place first the design lodged by Messrs. M'Arthy and Watson, architects, Edinburgh, for the new fever hospital. The second premium has been awarded to Mr. Alex. Cullen, architect, Glasgow, and the third to Mr. T. Martin Cappon, architect, Dundee. There were thirty-four competitive designs sent in.

GLASGOW.—The Springburn Halls competition has been settled. The assessors were Messrs. J. J. Burnet, A.R.S.A., T. L. Watson, F.R.I.B.A., and Mr. A. B. McDonald, M.Inst.C.E. The following is their award which has been adopted by the Corporation of Glasgow:—1st premium, Mr. Wm. B. Whitley, 196, St. Vincent-street; 2nd premium, Messrs. Thomson and Sandilands, West George-street; and the 3rd premium Messrs. Watson and Salmonds, St. Vincent-street. The plans have been on view in the Corporation Galleries, Sauchiehall-street, this week. Springburn is one of the districts added to the Glasgow municipal area some years ago, and one of the conditions of annexation was that suitable public halls were to be built. After being under consideration by the authorities for a considerable period, the matter has recently been somewhat hastened by the munificence of a well known local family, who offered to provide a winter garden in Springburn Park on condition that the Corporation agreed to proceed with the erection of the halls without further delay. This offer was at once accepted, and a competition confined to architects in Glasgow was instituted. Although no premiums were offered, nineteen sets of drawings were sent in, and from these the choice just given was made. The site is central, and is situated at the corner of Keppockhill-road and Millarbank-street. The cost is estimated at about £12,000. We are promised the loan of the premiated plans, which we hope to illustrate shortly.

NEW YORK.—The list of names of the architects chosen to compete for the New York Custom House is as follows:—Of the New York architects, those invited are Messrs. McKim, Mead and White, George B. Post, Bruce Price, Carrère and Hastings, Francis H. Kimball, James B. Baker, Cady, Berg and See, Clinton and Russell, Robert W. Gibson, Israel and Harder, Babb, Cook and Willard, Henry J. Hardenbergh, Cass Gilbert, Trowbridge and Livingston, George Martin Huss, and Howard, Cauldwell, and Morgan; from Boston, Messrs. Peabody and Stearns and Shepley, Rutan and Coolidge are invited; and Messrs. D. H. Burnham and Co. and Henry Ives Cobb from Chicago. This selection is said to have been made by Mr. James Knox Taylor, the supervising architect of the Treasury. Under the terms of the invitation the architect whose design is placed first is to be employed to carry it out at the regular commission of 5 per cent. for drawings and general superintendence, while no provision is made for second and third premiums, or for any compensation to other competitors than the one given first place.

The monthly report for May of the Labour Department states that employment in the building trades has continued good. The percentage of unemployed union members among carpenters and plumbers at the end of May was the same as in April—viz., 1.3. The percentage for May, 1898, was 1.2. In the furnishing trades employment has continued brisk. The percentage of unemployed union members at the end of May was 0.9 compared with 0.8 in April and with 1.0 per cent. in May of last year.

The Duchess of Albany on Wednesday last laid the foundation stone of the new buildings at St. John's Hospital, Lewisham. The architects are Messrs. Barnes-Williams, Ford, and Griffin. The buildings, which will provide for the reception of 33 additional patients, will be of red brick, with Monk's Park stone dressings and tiled roofs, and the contract has been let to Mr. H. L. Holloway at £5,370. The clerk of works is Mr. J. J. Trimm.

At the last meeting of the Court of the Stationers' Company, it was unanimously decided to confer the honorary Freedom of the Guild upon Mr. John Passmore Edwards, in recognition of his generosity towards the Caxton Convalescent Home and the Printers' Corporation, and as a mark of the members' appreciation of his liberality, judgment, and foresight in establishing Free Libraries in many parts of the United Kingdom.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

RECEIVED.—R. R. and Co.—P. J. C.—G. J. and Co.—C. M. G.—T. C. and Co.

"BUILDING NEWS" DESIGNING CLUB.

DRAWING RECEIVED.—"Vigornia."

## Correspondence.

## BIRTHDAY HONOURS.

To the Editor of the BUILDING NEWS.

SIR,—The fact that the commonplace list to which you refer in a recent issue contains names representing most of the professions and callings with the exception of that of architecture, has been very generally commented on; but is it not the natural result of a system which forces the individual to share the drawbacks belonging to the class to which he is attached?

Can we wonder that so long as the profession of architecture is not recognised by the State, those on whom the responsibility of selecting candidates for titular honours rests do not look upon us as a body with any degree of favour?

It is not the honours in themselves which are so desirable; but the want of that mark of appreciation implied by their being conferred is deplorable.

Does not this suggest that compulsory registration (which would result in the closing of the profession and the rendering of it collectively worthy of being placed on a level with the other closed professions) is a legitimate ambition, and one which it is worth while making some effort to achieve?

It is to be regretted that the R.I.B.A., who are unquestionably the proper body to take the lead in this matter, not only stand aloof, but collectively oppose the Bill now before Parliament, although individually largely in favour of it.

Is it not time that broader-minded views should prevail, and that the allied societies (many of whom have passed resolutions in favour of registration) and architects generally should combine, with the object of showing what the feeling of the profession really is on this vitally important subject?

In the interest of the profession, it cannot be too widely known that the Society of Architects has been for years, and is still, actively engaged in upholding and propagating the principle of compulsory registration.—I am, &c.

C. McARTHUR BUTLER, Sec.

Society of Architects, St. James' Hall,  
Piccadilly, W.

## Intercommunication.

## QUESTIONS.

[12251].—Quantities for Moulded Cornice.—Will someone acquainted explain how to take the quantities out for a moulded cornice return at the angle, and oblige?—A STUDENT.

[12252].—Expanded Metal in Plaster.—Does not the employment of expanded metal in plaster or concrete considerably strengthen the work, and render fewer intermediate supports necessary, say for a fireproof floor ceiling? Any information about the increased strength and cost will be of value to—A. K. S.

## REPLIES.

[12248].—The Soot Nuisance.—"Perplexed" complains of soot falling and dirtying carpets. The fault is in the construction of the flues, which ought to be so bent or curved as to avoid any great length of straight flue. An anti-down-draught cowl may be of some service. I should recommend corbelling out the brickwork in the throat of the flue so as to form a break.—G. H. G.

[12247].—Foundations by the Sea.—The railway line east of Dawlish—over which I usually travel twice every morning before breakfast—was built by the late Brunel close to the sea beach. Although exceedingly picturesque (I know none more so, save, perhaps, parts of the similarly-situated railroad between Cape Town and Simon's Town, S. Africa), there has always been much trouble with the foundations, and on several occasions in places the line has collapsed, or been totally washed away.

It now stands, in the main, upon wicker-work, and the wattle proves itself a better foundation in close proximity with the sea, than anything else. This query was put through the *Builder* several weeks ago, but elicited no reply.—HARRY HEMS.

[12247].—Foundations by the Sea.—Various means have been adopted to protect the shore—bundles of faggots or fascines, rows of piling, concrete, local rock, &c. Excavation between rows of piles, and filling in with concrete in block or rammed, is probably the best means for preparing foundations. The beds of shells may be utilised in the foundations, and will form a good aggregate for the cement grouting.—G. H.

[12249].—Right to Drains.—I do not think A has any remedy against B. The drain is probably not large enough for both houses. It is a matter for the local authority.—S. A.

[12250].—Architect's Responsibility.—I presume the word "spans" means spaces under floors. I am of opinion that an architect should provide for air bricks to ventilate the space under floor joists. If specified, the contractor is liable if they have been omitted. An architect can scarcely be held responsible for every timber put in, whether it was unseasoned or "green"; but for omissions in design he is liable.—G. H. G.

## Our Office Table.

THE gilded rosettes in the coffered ceilings of the transepts of St. Pauls, which were among the things most attacked by the critics of Sir William Richmond's decorations, are being removed. Sir William himself (a correspondent assures the *Daily News*) says that it is felt that while they are beautiful in themselves, they are not in consonance with the architectural stability effect which it is so desirable to preserve. The lettering on the frieze is also to be removed; the reason given being that it makes a transverse line at a place where that is not desirable, breaking the columnar effect which the upper portion of the dome demands. In answer to a remark that the colour of the ornament in certain places seemed to be too grey and cold, Sir William assented, and pointed out that this was much due to the fact that the windows in the dome are of cold green glass, and throw a cold light upon the colours, which, otherwise lit, would be warm. The windows are to be changed. "It is easy," says Sir William, "for a man to come in and in five minutes point out that this is wrong and that is bad, but only posterity can judge; and when the burst of praise or blame, either of which must be wrong, is over, we may all go on quietly. The decoration must go on: nothing will stop that."

At the meeting on Tuesday of the London County Council, the Establishment Committee announced the retirement of Mr. John Hebb, chief assistant architect, and recommended that applications be invited for the appointment, which is to carry a salary of £800 a year. This was agreed to. At the same meeting of the County Council it was resolved after considerable discussion that a portion of the site of Reid's Brewery, bounded by Clerkenwell-road, Gray's-inn-road, Portpool-lane, and Leather-lane, should be acquired for £200,000 under Part III. of the Housing of the Working Classes Act, and that application should be made to Parliament in the Session of 1900 to enable the Council to acquire compulsorily other lands adjoining this site. On the complete site it is proposed to re-house 3,000 persons of those who will be displaced by the Holborn to the Strand and Clare-market improvement schemes. The remainder of the people to be displaced are to be accommodated on the Millbank site.

MR. G. D. LESLIE, R.A., writes protesting against the proposal to destroy in the extension of South Kensington Museum the open quadrangle which at present forms the southern boundary of the refreshment rooms. Through the very centre of this little quad it is proposed to construct a broad and lofty inclosed passage. He suggests that this new corridor between the refreshment-room and the main entrance should be abandoned, and that the architect should instead complete the fourth side of the quadrangle, and substitute a fountain for the statue which is at present in its centre.

At a meeting of the election committee of the Institute of Sanitary Engineers, held on the 7th inst., the following members were elected:—Fellows: H. A. Chadwick, Durban, Natal; J. V. B. Collie, Cape Town. Associates: E. Box, Bexley Heath; W. Jenkinson, Worsley, Manchester; E. E. Rice, Teddington; H. T. Sidwell, Herne Bay; J. Whelan, Dublin.

## MEETINGS FOR THE ENSUING WEEK.

FRIDAY (TO-DAY).—Carpenters' Company. Practical Examination at the Company's Schools, Great Titchfield-street. 9.30 a.m. to 5.30 p.m.

SATURDAY (TO-MORROW).—Carpenters' Company. Voice Examination at their Hall. 12.0 noon.

Architectural Association. Visit to Gattin Park and Church. Train 2.6 p.m. from Charing Cross to Merstham.

## THE ARCHITECTURAL ASSOCIATION.

JULY 1st.—VISIT TO SHOOTER'S HILL HOUSE, Pangbourne (Leonard Stokes, Architect), and to a large House in course of erection (J. Belcher, Architect). Meet on platform at Paddington for 1.33 train. P.O. 5s. to be sent to Mr. FRANCIS HOOPER, 12, Norfolk-street, Strand, before June 28th.

G. E. CARVILL } Hon. Secs.  
R. S. BALFOUR }

## Trade News.

## WAGES MOVEMENTS.

THE DISPUTE IN THE BUILDING TRADE.—The result of the plasterers' ballot, declared at Westminster on Saturday, shows 4,559 votes in favour of accepting the terms arranged at a conference held in London, and 368 against. Four retiring members of the executive have been re-elected by an overwhelming majority. The very satisfactory result is that the men will return to work after the official withdrawal of the lock-out notices by the employers, and the local rules will be amended to meet the requirements of the agreed terms. An important meeting of the representatives of the unions concerned in the present dispute in the building trade was held in Manchester on Monday. At the Derby conference a week previously the withdrawal of the lock-out in Yorkshire was made conditional on the representatives of the men agreeing to a basis for a joint conference, submitted by the editor of the *Daily News*. The men could not accept the basis, and suggested that they could only deal with the question of conciliation. The men were asked to submit their alternate proposals within a fortnight, and Monday's meeting was held to consider their position. The chair was occupied by Mr. Wilson, president of the Amalgamated Society of Carpenters and Joiners. The question of a basis for a conference was discussed at great length, and a basis of settlement by the appointment of a joint conciliation board to consider all questions in dispute was drawn up. This will have to be submitted to the executive committees of the various bodies represented for their special consideration, and the reports thereon will be received at another meeting to be held next Monday. It will thus be impossible to forward the reply to the employers within 14 days.

GRIMSBY.—The whole of the Grimsby bricklayers came out on strike on Monday for an advance in wages of 1d. per hour. The period is most favourable for the men, as there is a great demand for houses, and building operations were in full swing.

LANCASTER.—The master plasterers and operatives have come to terms, and by the settlement the men will get an advance in wages from 8½d. to 9½d. per hour. Work was resumed on Monday.

MIDDLESBROUGH.—A joint meeting of the representatives of the masters and men in the building trade was held at the Albany Restaurant on Thursday night in last week. A protracted meeting resulted in the masters offering the men an advance of ½d. per hour, making a wage at the rate of 9½d. per hour for ordinary purposes, with a rate of 10d. per hour in the works, but without allowing walking time. They also suggested that a committee of masters and men should be formed to consider the question of working rules, and to act as a board of conciliation for the trade in the town. The men's representatives promised to lay the masters' suggestion before the men.

NEWCASTLE-ON-TYNE.—On Saturday the joiners of Newcastle and district, numbering about 700, struck work for an advance of wages from 9½d. to 10d. per hour. The men decline to submit the matter to arbitration.

SHIELDS.—The house joiners of North and South Shields came out on strike on Monday in accordance with the decision previously arrived at on the masters refusing to concede an advance from 9½d. to 10d. an hour. Upwards of 400 men are affected. The men decline to submit the question to arbitration.

THE GREAT STRIKE IN THE DANISH BUILDING TRADE.—The Danish employers have sent a letter to the German association of employers in the building trade explaining the motives which induced them to declare a general lock-out, and requesting the latter not to give employment to any Danish workmen during the continuance of the lock-out. They add that they will readily do the same for the German employers in the event of future troubles in the German building trade. It is

reported that owing to the magnitude and seriousness of the lock-out attempts are being made to induce the Crown Prince of Denmark to offer his mediation.

WALSALL.—The builders' labourers' strike, which had existed for the last ten weeks, has now been settled. The demand of the men was for an advance of ½d. per hour, while the masters were willing to give ½d. now and ½d. in six months. Terms have been arranged by which the men receive an advance of ½d. an hour, with no arrangement for any further sum in the future.

WIGAN.—The stonemason's strike, after lasting six weeks, has come to an end. At a meeting of representatives of employers and operators, called on Tuesday by the editor of the *Wigan Observer*, who was asked to preside, terms were mutually agreed to, concessions being made by both sides. The wages are advanced to 9½d. per hour from July 1. Certain alterations were made in the rules, and a conciliation board consisting of joint representatives was appointed to deal with minor disputes. In case of future proposed alterations in rules six months' notice is to be given, terminable on May 1 in each year. The President of the Board of Trade was empowered to appoint an umpire failing settlement by the joint arbitration board. Work will be resumed at once.

YORKSHIRE BUILDING TRADE AND CONCILIATION.—At a meeting of the Northern Centre of the Master Builders' Federation, held in Leeds on Wednesday, a resolution was passed approving the suggested national conciliation board for the building trade, but declaring that steps must first be taken to clear up the matters contained in the Yorkshire masters' manifesto. It was proposed that a conference of the Yorkshire masters and trade union representatives be arranged for, in which case the lock-out of 25 per cent. would be withdrawn.

## CHIPS.

An adjudication in bankruptcy has been made in the case of George Haines, of Ross, surveyor.

Mr. W. Vincent Vale, accountant, 16, Darlington-street, Wolverhampton, has been appointed secretary to the Wolverhampton branch of the National Association of Master Builders of Great Britain and Ireland, to whom all communications should be addressed, Mr. George Gough having resigned.

A busy week's transactions at the Auction Mart, Tokenhouse Yard, closed on Friday, yielded a return of £326,510. Although the chief event, the Thorp Perrow Estate, failed at the hammer, several residential estates of less magnitude changed hands thus, with general satisfaction.

Considerable alterations are being made to the council-chamber and police-court at Devonport, from the designs of Mr. J. F. Burns, the borough surveyor, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

At Winchester on Thursday in last week the Prince of Wales laid the foundation-stone of the new rifle barracks. They will replace the older ones destroyed by fire 3½ years ago, and which were built from designs by Sir Christopher Wren, originally being intended as a palace for Charles II. The new barracks will be 496ft. long and about 32ft. deep, and will be four stories in height. They are being constructed on a War Office contract, the principal officers being Colonel Mascall, commanding R.E., Southern District, Colonel Maycock, C.R.E., Gosport, Captain Harvey, R.E., and Mr. E. North, R.E.C.S. The foundations have been put in by Mr. Henry Gough, principal of the firm of J. and M. Patrick, of Wandsworth and Rochester.

## "SANITAS" DISTEMPER.

VOL. LXXVI.—No. 2320.

FRIDAY, JUNE 23, 1899.

### ARCHITECTS' SUPERVISION.

A DECISION likely to establish a dangerous precedent has been lately given in a judgment pronounced in an action for alleged breach of contract in the Edinburgh Court of Session, in which Miss Mary Hope Jameson sued Mr. Frank Worthington Simon, architect, for damages for £80. We refer the reader to our report of the proceedings given in our "Legal Intelligence" last week for the details, and we simply here deal with the main question involved and the broader features of the case. In brief, the question raised was, What kind or amount of supervision is implied in an architect's employment? or, Is an architect responsible for any failure in the carrying out of the specification by the tradesman employed? According to the evidence given, it appears the pursuer built a villa near Edinburgh, and employed an architect who, in the ordinary course of his duty, had to supervise the contractors. These were, it is stated, a mason and a carpenter, between whom the responsibility rested of seeing that the work was carried out in accordance with the design and specification. Each threw the blame on the other, and so the pursuer sought redress against the luckless architect, who appears to have taken a good deal of trouble on the pursuer's behalf. The defendant architect stood high, there was no imputation on his competence, all the pursuer alleged being that, as the result of want of proper supervision, dry rot was introduced into the building, which had caused much trouble and expense to eradicate. According to the evidence summed up by Lord Kyllachy, the dry rot originated in the materials used in the "bottoming" which formed the foundation or substratum of the cement floors of the scullery, coal-cellar, &c., forming part of the ground floor of the villa. The materials to form this "bottoming" were specified to consist of 2½ft. of broken stone, the uppermost 3in. layer to be of small stones, and to be supplied by the plasterer, and the rest was described as "dry stone filling," to be supplied by the mason. This upper layer was substituted by rubbish, and, it is alleged, consisted of chips of stone with about "25 per cent. of shavings, pieces of wood, plaster, sacking, and general sweepings." Being covered by cement and the air excluded, it is thought this rubbish generated the dry rot fungus on the rotten wood core, and from thence the rot spread to the door-posts of the kitchen and scullery, which posts were imbedded in the "bottoming," and thus involved the other woodwork.

Probably this is the first time the spread of dry rot has been attributed to the want of supervision on the part of the architect. There is apparently no direct evidence to show that the dry rot originated in, or was generated by, the decayed wood rubbish; it might have been in the woodwork of the posts. That the material upon which the cement paving was laid was improper will not be disputed; but we should like to know how it is possible for an architect to so arrange his visits to a building in progress that he should be able to examine at the exact time the mixture of the materials, to see if they are strictly in accordance with the specification standard. Much less can it be expected that an architect should so time his visits as to see that every yard of concrete for the foundations has been composed of the right proportions of Portland cement or lime with ballast or aggregate, or that every hod of

mortar contains just the right quantity of fresh-stone lime and clean sharp sand that is necessary to substantial building. But are such ideas of supervision entertained by any practical man? Concrete and mortar are, in fact, of much greater importance than "bottoming" materials, and yet we cannot imagine any Court holding an architect responsible for any defect caused by an improper admixture of these materials. If we remember rightly, some years ago an architect was sued by a client for some imperfection in the laying of drains, whereby illness was caused to a tenant, and the owner was put to expense; but the judge held that it was not reasonable to expect an architect to see that every drain-pipe was properly laid in accordance with the specification. Details of this kind could not be reasonably expected of him to look to.

In the present case, a very different view has been upheld. His Lordship, while admitting that there was no special contract as to the kind or degree of supervision which an architect should exercise, lays it down that as an architect certifies that the work done has been done according to contract, "he *prima facie* must be held to warrant that, so far as he could ascertain by reasonable care and skill, there had been no scamping of the work or serious deviation from the plans and specification." "Reasonable care and skill" implies a degree. But this construction of the duty of the architect carries with it responsibilities which, on the face of the matter, are both unreasonable and unjust. The certificates of an architect can hardly be understood to imply the meaning here attached, or to warrant that the work is "done according to the contract." If it does, the ruling of such cases as "Laidlaw v. The Hastings Pier Company" and "Lord Bateman v. Thompson" cannot be maintained. In both these cases the ruling was practically that the architect's certificate is to be conclusive, even if certain defects appear, that the architect is to be judge of the soundness and sufficiency of the materials. In his important judgment given in "Chapman v. Walton," Tindal, C. J., speaking on an action arising out of alleged want of care and skill, said, "The question whether a person has exercised reasonable and proper care and skill appears to us to rest upon the inquiry whether other persons exercising the same profession or calling, and being men of experience or skill therein, would or would not have come to the same conclusion as the defendant. For the defendant did not contract that he would bring to the performance of his duty on this occasion an extraordinary degree of skill, but only a reasonable and ordinary proportion of it," &c. And he said the most reasonable mode of determining such question is to show whether nine out of ten professional men would have done the same as the defendant has done under the circumstances. If we were to apply this principle, which is a reasonable one, to the question of architect's supervision, such a decision as that of the Court of Session could hardly have been given. An architect naturally assumes that work he does not see has been honestly carried out according to the contract. Without such ordinary reliance on the contractor, it would be impossible to carry out any contract. If there is no clerk of works, there is the greater reason why the architect should rely on the good faith of the contractor. But Lord Kyllachy says the question of the architect's obligation as to whether the work was duly and properly executed was one not for the profession to decide, but for the Court. So that, in fact, the usual custom of the profession as to these points is to be set aside. His Lordship, applying this view, held that the defender had failed to show he gave due and reasonable supervision, or did not materially contribute to the cause of mischief.

We cannot see how the defender in this case could, without constant daily attendance, have averted the mischief. It is suggested that he might have sent down an assistant during the day or two when this particular work was going on; or that the layer might be left open for his inspection until he had seen it, which proposals are more easily made than acted on. The question is a momentous one for the profession, and the judgment, as it stands, imposes upon the architect obligations that cannot with any justice be fulfilled by him. We are not surprised to hear that it has evoked much surprise. One correspondent speaks strongly of its unfairness, and proposes an appeal.

### ADMINISTRATION OF BUILDING BY-LAWS.

WE have lately drawn attention to the present very unsatisfactory working of building by-laws outside the Metropolis. Many of these are under private Acts of Parliament, the larger number of urban districts having adopted by-laws under the Public Health Acts. Even these by-laws are not based on one uniform code, the Local Government Board Model By-laws not being adhered to in all cases. These local district by-laws vary from each other, and when the districts adjoin, considerable inconvenience and friction to building owners and the profession are experienced. Not only is this the case. Rural sanitary authorities can obtain "urban powers" from the Local Government Board, and adopt the by-laws of the urban districts, so that builders in country and half-rural districts have to comply with the same severe building regulations as obtain in closely-built towns. A great hardship is inflicted by this uniformity of regulation, without any corresponding advantage. The builder in a rural district has to conform to many details which are quite unnecessary and often objectionable.

The report of the Special Committee of the Royal Institute of British Architects, suggesting that the Model By-laws should be grouped in divisions, and which we published *in extenso* last week, is a step in the right direction. By this arrangement it is thought the present anomalies may be removed, that by-laws relating to the same class of building may be made uniform, and that buildings in rural districts may be relieved from regulations which are inapplicable and vexatious. Our readers will notice six general divisions are proposed:—A, definition of terms; B, new streets; C, spaces about buildings and areas of windows; D, structure of party-walls; E, structure of walls, foundations, roofs, and chimneys; F, sanitation, preparation of site and drainage. The committee think that for rural districts divisions A, D, and F will suffice, though for some purposes B and E might be added when any part of the rural district was likely to become urban, or when large public buildings or factories of considerable height were erected. Under the class of domestic buildings would be placed the ordinary shop. On the other hand, in towns where there is a building surveyor, the whole of the by-laws should be, it is thought, in force, and exemptions should apply to certain buildings rather than to districts; but no buildings should be exempted from supervision as to sanitation and drainage, which rule should extend to railway stations.

These suggestions are equivalent to saying that the by-laws, as a whole, should apply to towns of any size, and only partially to the rural districts. It would be better to say they should apply to certain conditions of building. In country buildings the main structural requirements are a proper party-wall between houses belonging to different owners, and proper drainage. These are certainly conditions precedent to all safe and healthy building everywhere;

protection against fire and sewer-gas are absolutely essential to all. To a lesser extent the rules about the materials for external walls and cross-walls apply. It is absurd, as we have pointed out, that half-timber walls should be prohibited, or so fenced round with restrictions that no dwelling should be constructed with them unless distant 15ft. from any adjoining building; it is also vexatious to require structural provisions, such as those in clauses 23, 33, 34, as to openings in external walls, girders, bresssummers and their bearings.

The appendix to the report contains proposed amendments and substitutions of the existing Model By-laws. Under division A it is proposed to substitute for by-law No. 2 sub-clauses (h), (i), and (j), which relate to exemptions. The first of these clauses exempts buildings used for plant-houses, summer-houses, &c., detached and at a distance of 10ft. at least from any other building, and heated by hot water, the second exempts any building not exceeding 30ft. in height and not more than 125,000c.ft. not being a public building and not constructed wholly or partly for human habitation and distant 30ft. from the nearest building, &c.; the third exempts any building which shall exceed in height 30ft., shall exceed the above area, not being a public building or used for habitation, and which shall be distant at least 60ft. from the nearest building, &c. The committee's report proposes to substitute for the above the following amended clauses:—

Any building not being a public building or factory except those of only one story in height and is without a gallery and is situated not less than 15ft. from the boundary of the curtilage; two domestic buildings being regarded as one provided they are separated by a party-wall: any building within 15ft. of the boundary of the curtilage distant 15ft. from any public way, and from any other building within the curtilage, and that does not exceed 600sq.ft. in area, nor 15ft. in height, provided that its external wall or party-wall towards the boundary is constructed as a party-wall prescribed; also greenhouses not attached, and those attached to other buildings, so far as regards the necessary woodwork, &c.

These clauses are more simple in phraseology; the distances from the nearest building have been in each case reduced 15ft. On the other hand, the height is also cut down to half, and the area lessened. Practically the clauses exempt smaller buildings. No public building or factory is exempted from any by-laws regulating exits and stairs.

By-law No. 54 provides an open space in the rear of a new domestic building of an aggregate extent of 150sq.ft. free from any erection above the level of the ground, except a w.c., &c. As it stands, this beneficent provision provides an area unenclosed. The proposed amendment is to add to it section 41 of the London Building Act slightly modified, the effect of which is to permit the open space, required to be provided, to be above the level of the ground story ceiling. It would be better in the case of new buildings in crowded parts to provide for an open space from the ground or pavement level. The clause as it stands appears to allow the existence of a ground story, "not constructed or adapted to be inhabited," a not very desirable condition for a town building. Other London Building Act sections relating to open spaces are suggested as desirable, as sections 45 and 52.

Division D deals with party-walls, and refers to various by-laws, Nos. 19, 20, 21, 22, &c. The amended clauses fulfil fairly the necessary conditions and follow those of the by-laws; in certain cases they provide that the party-wall be carried up above the flat, gutter, or roof of the highest adjoining building to such height as will give a distance of 15in. at right angles to the slope of roof

and be properly coped. These cases are as follows:—When the adjoining building is not covered with slates, tiles, or other incombustible material; when either of the adjoining buildings exceeds 30ft. in height; when either is intended to be used as a public building, a warehouse or factory. When of the latter class, and it exceeds 30ft. in height, the party-wall is to be carried up 36in. above the roof-flat or gutter, and to extend 12in. higher and wider on each side of any turret, dormer, lantern light, &c., if within 4ft. of said wall. These clauses practically are the same as the present by-laws; but they do not apply to buildings under 30ft. in height, or those covered with slate or other incombustible materials. We prefer the existing clauses.

A more desirable addition to the model by-laws (No. 11, Division E) will allow any story in a roof, or below it, of a detached or semi-detached house to be inclosed with timber studding 4in. thick, covered externally with weather tiling or plastering, and such story may be corbelled out or overhang the wall below. The old by-laws unduly restrict the architect in semi-rural and suburban districts, and only brick walls or stud walls filled with brickwork is allowed, and then only in cases where the house is distant not less than 15ft. from any adjoining building. Tile-hung walls also should be exempted from the rules as to ordinary walls in the case of single stories. We postpone for consideration other alterations of the By-laws as to the structure of walls and sanitation. The provincial practitioners and builders will have something to say to the suggested amendments, and it is well that the allied societies have been consulted. The subject is one that appeals most directly to the provincial architect, and it would be an error to imagine that one set of rules, even when arranged in divisions, will suit all the localities or authorities concerned.

#### ESTIMATES.—XI.

##### MASON'S WORK, WALLING, SLATING.

IN pricing columns, it is best to take out rough quantities, as in other cases we have shown. We ascertain first the cube stone in shaft by squaring the diameter at base of each frustum, and multiplying by the height of each stone in the shaft. Then we take the cube stone in cap and base by the full outside dimensions of each. We next measure the "plain work" of shaft, take each stone on two sides, the dimensions being taken thus:—Supposing the bottom stone to be 5ft. high by 2 5 0 1ft. 6in. in largest diameter, the next stone would be, say, 4ft. 9in. by 1ft. 2 4 9 5in. diameter, and the dimensions would be put down as in margin. Each sum is "twiced" to take the four sides of each stone. Next, the "circular work" of shaft is taken, the dimensions being the height of each stone as before by the circumference as in the margin.

The "plain work" of base and cap is taken the full width of each squared, and the "circular moulded" work to each. The circumference (average) by the girt of mouldings, the dimensions appearing as follows:—

1 11	Cube stone in capital.
1 11	
0	
1 11	Plain work to bed.
1 11	
2 1 11	Plain work to sides.
9	
6 3	
8	Circular moulded work.

The base would be similarly taken. In addition to these there would be "sunk work" to bed of joggle. Then price the items as before.

##### YORK STONE WORK.

We resume the items of York stone work, commenced in our last article. Laxton gives the following prices per foot cube, including all labour and profit:—

	£	s.	d.
"Robin Hood" in block (20ft. average)	0	3	2
"Potter Newton" ditto.	0	3	0
Hard York ditto.	0	3	3

Ditto, including waste and cartage within four miles of depot, per foot cube:—

	£	s.	d.
"Robin Hood" .....	0	4	0
"Potter Newton" .....	0	3	9
Hard York .....	0	4	1

8ft. run. 9in. by 3in. rubbed step, back-jointed.

Sawn York may be priced at 1s. 2d. per foot super. delivered, say—

	£	s.	d.
Sawn York, 9in. at 1s. 2d. ....	0	0	10½
Waste, 10 per cent. ....	0	4	0
Half-sawing to edges, 6in. ....	0	0	2
Rubbing to face and edge, 1ft. ....	0	0	2
Setting, &c. ....	0	0	3
	0	1	6½

8ft. run. 12in. by 3in. rubbed step, back-jointed.

	£	s.	d.
Price of sawn landing of this length, per foot run, as last .....	0	1	6½
Add one-quarter for extra 3in., say .....	0	0	4½
Profit, &c. ....	0	0	3
	0	2	2

60ft. super. Purbeck stone paving in straight courses laid.

This may be done at about 1s. 6d. per foot super., including profit, &c.

No. 1. York stone sink, 4ft. by 2ft. 6in., 7in. deep, tooled and dished, rounded at corners, with rebated hole for trap, cut and pinned to wall.

This may be priced at about 3s. 6d. to 4s. per foot super. There would be 10ft. super. in this sink, which at, say, 3s. 6d., is £1 15s. Add labour, rounding corners, making perforation, 4ft. pinning to wall, say 4s. 6d., or in all £2 for price of sink. When quarry worked, 30s. is a usual price.

##### STONE WALLING.

In pricing items of this description, the estimator should ascertain the cost of stone at the quarry, or the price per ton in truck at the station, the railway rate, &c. The practice of measuring differs considerably in different localities. In Scotland it is measured by the super. yard to a reduced thickness of 24in., any thickness over being reduced to this. In London Kentish rag is generally used for rubble walling, and is measured by the cube yard. Generally it is used as a facing to brickwork. For solid rubble walls, where the facings are of the same sort of stone, the whole is taken at per yard cube, and the facing taken per foot super., as "extra on rubble." Dressings, as stringcourses, jambs, quoins, &c., should be priced as extra, taking care to consider the labour, beds and joints. For facing consider the average size and number of through stones per yard super. average bed of facing, &c.

Rough stone is sold by the ton, and it may be taken approximately that a yard super. of rubble walling 20in. thick will require about 1½ tons of stone, including waste. Quarry-prepared facings are also sold by the ton, and this quantity will roughly equal about three yards super. with a 6in. bed.

Laxton gives the following data. Assuming the price of 5s. per cube yard for the stone delivered:—

	£	s.	d.
Rubble in walls of 20in. thick per yard super. would be .....	0	10	6
Ditto ditto 14in. thick .....	0	8	0
Extra on above for scapped face and struck joint, per yard super. ....	0	3	0
Extra for rock-worked facings and pointing with parallel joint .....	0	5	3
Ditto, scapped facings for quoins, &c., per foot run .....	0	0	4

These prices are only to be taken as a guide,

and the builder ought to obtain a price for this particular work.

Rough Kentish rag delivered within four miles of the Thames is quoted at 6s. 10d. per ton, and Kentish rag random walling, including labour, scaffolding, profit, &c., per yard cube, 16s. 6d.; random-coursed walling at £1 per yard cube.

The elements of cost are: price put on trucks or barges at Maidstone, railway rate to nearest station, rate by barge, unloading and loading into carts, distance of site. Let us say the random-dressed ragstone in trucks at quarry is 7s. per ton; add railway carriage 2s. 3d., unloading 6d., cartage to site, say 3s., equal to 12s. 9d. per ton. In courses of irregular height the price is about 11s. to 12s. per ton on trucks. Allowing a bed of 7in., a ton will cover about 3½ yards super. Extra cost on brickwork per foot super, for facing of Kentish ragstone may be put at 4d. or 5d. This includes extra value of stone, mortar, labour facing, striking joints, &c.

210 yards cube. Random walling, including labour and scaffolding.

This may be priced at 16s. 6d. per yard cube; if random-coursed, add 4s. per yard cube.

1,014ft. super. Facing of Kentish rag stone in courses, hammer-dressed, average 7in. in bed, in mortar, pointed with joint in blue-ash mortar.

If we take hammer-dressed facing in courses of irregular height at, say, 12s. per ton on trucks, railway carriage 3s. 6d., unloading and loading 6d. per ton, cartage, say, 3s. per ton = 19s.; then 19s. ÷ 30ft. (feet super. in 3½ yards, 7in. on bed) will equal about 7½d. per foot super.

Cost of foot super	£ s. d.
Blue ash mortar, say	0 6 7½
Striking joints	0 0 0½
Per super foot	0 0 8½

This is equal to about 30s. per yard cube.

536ft. super. Extra on rubble walling for stone facing, roughly hammer-dressed, raking out, and pointing with blue-ash mortar, well bonded to the work behind.

This item may be priced at 4½d. to 5d. per foot super.

130ft. run. Extra on facing, dressing quoins, with tool chisel draft on each angle.

Put this down at, say, 10d. per foot run.

No. 4. Extra relieving arches. 5ft. long, 12in. on bed, including all cutting.

If we suppose the arches are 12in. high on face, there would be 10ft. super. in each. We may price the extra labour at about 6d. per foot.

35ft. run. Labour to roughly squaring quoin stones to random work.

A fair price for this item would be 6d.

18ft. run super. Rough cutting to rakes and splays.

This item would be for cutting to gable ends, and splayed corners and jambs. For rough cutting, 2d. to 2½d. per foot would be sufficient. These prices include scaffolding and profit.

#### SLATER.

Pricing the items of this trade ought not to be difficult if proper rules to cover extra labour and waste were followed. Sometimes an allowance is made in the superficial quantity for eaves, hips, and valleys; but the better plan is to describe each. All voids should be deducted, and make allowance for cuttings to deductions by the length of the edges of the void by 6in., also for all irregular edges. Cutting to hips and valleys is generally measured by the length by 6in. on each side. Dormers and skylights should be deducted and described. Certain rules of measurement have been adopted by leading

slate firms. For eaves, the length by half the length of full-size slate used at eaves; cuttings and valleys as described above; dormer sides, length by 6in. on each side; skylights and chimneys the same; for deductions, all openings more than 4 sup.ft. For work circular on plan, allow in price at least one-third extra; if the radius is small, as to a conical turret roof, allow one-half extra.

Prices for the best Portmadoc slates may be obtained from Davies Bros., Portmadoc, N. Wales. North Wales Slate Co., Portmadoc:—

50sqrs. 25ft. super. Best Bangor Countess slating, 20in. by 10in., laid to a 2½in. lap, with two 1½in. copper nails to each slate.

Best Bangor Countess slates cost about £12 per "thousand" of 1,200, delivered, and 150 slates covers a square.

Cost of 150 slates at above rate	£ s. d.
Copper nails, say, 2lb. at 1s.	1 10 0
Labour	0 2 0
	0 3 0

Profit	1 15 0
	3 6
	1 18 6

This works out rather high for a large quantity. £1 17s. is a fair price.

73sqrs. 10ft. super. Best green Westmoreland slating, laid to a 3in. lap in diminishing courses, with two 1½in. copper nails to each slate.

Cost of best Tilberthwaite green slates on truck at Coniston is £5 15s. per ton. One ton will cover, say, 30sq. yds. If we take a third to the square, cost will be about	£ s. d.
Railway rate, &c.	1 18 0
Copper nails as before, say	0 6 0
Labour, say	0 2 0
	0 5 0

Profits 10 per cent.	2 11 0
	5 0

Per square	2 16 0
------------	--------

We see Laxton gives £2 15s. per square for best Tilberthwaite slates, 3in. lap, with copper nails.

Slating is often let to a firm, and this is the cheaper way.

10 squares 35ft. super ditto, but in smaller graduated sizes to curved eaves.

Add to the former price labour cutting to slates.

Cost of a square, say	£ s. d.
Cutting to graduated sizes	2 15 0
Waste, 5 per cent.	0 2 6
	0 2 6

	3 0 0
--	-------

56ft. run. Cut and mitred hip in oil cement.

Put this down at about 8d. per foot run for small quantities, but for large orders 6d. is sufficient.

25ft. run. Double course at eaves.

Put the extra course at	£ s. d.
Cement, fillet, and labour	0 0 4½
	0 0 2
	0 0 6½

26 squares 80ft. super. Slating with Whitland Abbey green slates, laid with 2½in. lap, and with zinc nails.

This item may be put down at the same as the Bangor, £1 18s. 6d. Laxton prices it at £2 5s. per square.

22ft. run. Patent slate ridging, with 2in. roll and flat sides.

This will cost from about 1s. to 1s. 6d. per foot run.

56ft. run. Bedding, eaves, labour only.

Price this at a 1d. per foot.

56ft. run. Filleting to ditto.

Price this also at a 1d. per foot.

40ft. run. Undercloak of slate to verge, bedded in cement.

Put 4d. for this, add for cement 2d.

25ft. run. Mitred hip with wide slates, and bedded in cement.

Price at 8d. or 9d.

1 cistern of sawn Welsh slate in five pieces, 6ft. long, including bolts, &c., and fixing.

Suppose the slabs are 1½in. thick, put,	£ s. d.
say, per foot super.	0 2 0
Cartage, ditto	0 0 1½
Oil and cement, ditto	0 0 1½
Fixing, ditto	0 0 1½

Per foot super.	0 2 4½
-----------------	--------

22ft. super. 1in. sawn slate shelf, quarry planed in slabs 5ft. long and 3ft. wide, rounded nosings.

These slabs cost about 1s. 2d. per foot super. Add fixing 2½d., and for rounded nosings 4d.; in all, 1s. 8½d. per foot.

72ft. run. Slate skirting, 9in. wide and ¾in. thick, and fixing.

This item may be priced at 10d. per foot run, including profit.

No. 3. Enamelled slate chimneypieces, with 8in. jambs and 9in. shelves.

Obtain price from some leading firms of slate merchants. The prices vary from about £1 10s. to about £3. Chamfered and moulded shelves, panels, and trusses increase the cost.

#### "BUILDING NEWS" DESIGNING CLUB.

##### A SMALL PARISH SCHOOL.

THE designs submitted for this subject are numerous and fairly good, even if specialists in school-planning may look in vain for any exact degree of freshness or originality of arrangement. The hillside site specified gives an individuality to the contrivance consequent upon the fall of the land from front to back, the building-line being level with the frontage, which is considerably above the playground on the south side at the back of the buildings. Here is the text of the conditions issued for the guidance of competitors:—A Small School for a country parish, situate on a hill-side, and having a frontage towards the main road, which is level. The ground falls some 10ft. southwards from the frontage line, so that a covered playground is to be contrived under the main buildings, the ground-floor level of which is to be 1ft. above the footway. The building-line is to be fair with the frontage. The accommodation to provide a central hall 46ft. by 25ft., with four classrooms opening out of it, and adapted to be thrown into the hall on the occasion of general assembly and for public meetings. Cloak-rooms and conveniences for both sexes, and distinct entrances to be provided, also a bell-turret. Economy of contrivance and proper arrangement of classroom seating to receive careful attention, and be shown on the plan. The treatment of the building externally to be simple and picturesque, adapted for stone, with slab slates for the roof. Sufficient representations of the design to be furnished to illustrate the scheme properly, and a view sketch from the roadside to be given. Scale, 8ft. to the inch for elevations and section. Plans may be to the scale of 16ft. to the inch.

We place "Thistle" first, "Dachs" second, and "Swan" third. The plans which come next in merit run "Swan" very hard for the position we have just accorded him.

"Thistle" provides no stairway or steps down into the playground, trusting to slopes, which scarcely was what we intended, though, as seen in the side elevation, this arrangement looks unobjectionable, and at least there are no steps to fall down. In wet weather it would have been an advantage, perhaps, to reach the covered playground without necessarily going outside down a well-trodden slippery slope. The classrooms are lighted from the left-hand side of the pupils seated in their places, and there are separate cloak-rooms and entrances as required. The master and mistress have office-rooms and a lavatory each. The children's latrines are at the back of the playground. Externally the building looks like its purpose, with a regard to the specified materials of stone and slab stone slates. There is, no doubt, a thoroughly modern look about the building, and archaeological considerations cannot be complained of. That, with some

is an advantage. For our own part, we should have liked the design better if the gables had been more symmetrical, and the porch heads not so heavy, while the bell-turret does not look very happy in perspective.

The second design, of which "Dachs" is the author, has the merit of becoming its parts, and this, too, in a modern style of treatment: but we cannot ignore the side dormers to the central hall as "Dachs" has done in making his perspective and north elevation. These dormers show in the east and west façades. The classrooms are not in two instances lighted from the left hand of the pupils, as they ought to be. The teachers have a common room, but no private convenience of their own. The steps down to the lower playground seem an advantage, though it is not clear how the heating chamber is managed. The general effect of the external treatment is pleasing, and the low hipped roofs to the cloak rooms would be reckoned quaint, and with this idea the twirly clip-irons to the eaves-guttering are made much of. Such expedients are not worthy of so much prominence. We again observe that "Dachs" was unfair in leaving out the dormers, as they would really interfere with the simple lines depended on for the effect of the front elevation. In spite of this protest, we consider "Dachs" must take the second place, and so we accord it to him. "Swan's" plan, put third, brings the cloak-room wings right up to the frontage entering the boys' and girls' doorways directly off the highway. The central hall is lofty, but the valley over the middle is an objection, and the interior of the roof is ugly. The front elevation is one of the best, but we do not approve of the trick adopted by "Swan" of blacking in some of the window panes in symmetrical line and leaving some of the others quite white. "McGilligan" is very mannered, gaining nothing by drawing in his trees so oddly or his building so crudely. His plan includes staircases down to the playground inside the building; but there is no need to have separate corridors, thus sacrificing space where every inch has to be economised. The hall-end gable windows would run down hard upon the gutter over the corridor in rather a risky way. The porches are not very pretty, and generally the effect is not happy. "Quadrant" is another design which runs "Swan" very hard, but the class-rooms do not group so well out of the central hall. The elevation towards the street is too cut up and fanciful in a plain sort of way. Long openings like those through the front gables are strange, but the view makes the effect stranger still by showing the uprights between the range of lights far too thin for the work they would have to do. In the geometrical drawing the true intention of the designer is better indicated. The turret and the dormer below it are rather trumpery. The bald back elevation is really the best part of "Quadrant's" work. "Red Rose" ignores the rule as to the size and proportion of the paper to be used. This is a pity, for his plan shows knowledge and skill. The teacher would have to put up with shortcomings, and the heating-chamber out of the boys' play-shed is a very bad contrivance. The elevations are suitable and unquestionable, though the sketch from the road imparts a commonplace look to the whole thing. "Tokio" gives a common-sense and artistic character to his schools—merit of no common order. His plan is compact, and not bad, in spite of its crowded look. The lead flats over the teachers' places and over the porches are ungainly and ill-considered. "Astragal" delineates with a coarse ink line, to give force presumably to his contribution; but it takes its scale of effect away. The plan is rather good, and we like the elevation; but the drawing is excessively poor. The portals are overdone, and too large. "Tip" marks his school with a tower-like turret and a sprawling hood over the hall main window. His plan, very like some already mentioned, is suitable; but the objection of not being able to reach the playground without coming into the street is a very serious one, and "Tip" has overlooked the condition as to size of the sheets. The heating-chamber to the back of the girls' covered play-shed is cramped and very objectionable. "Vigornia" is not so economical, and shows a plan arranged with a stage for entertainments, all the classrooms being thrown into the central hall. This is on the lines we suggested. The teachers' rooms then become retiring rooms for ladies and gentlemen. The author has made a pleasing design, and not a bad school plan; but the classrooms are not well lighted for desk-work, and

DECORATIVE FIGURE ON THE MONUMENT TO THE BOURGMESTRE J. ANSPACH, BRUSSELS.—JULIEN DILLENS, Sculptor.

"Vigornia" has tried to do too much in providing for the occasional use of a building to the detriment in detail of the school proper. "Arc" gives us ugly windows, and tries to disguise their ugliness by the device before complained of in blacking-in the lights in an artificial manner half-way up the fenestration. The battered chimney stacks add a quaintness, and the bold outline drawings are assertive; but, on a closer inspection, the work is crude and faulty. "Bedouin" is a more careful student, but the master's and mistress's rooms side by side at the end of the hall do not make a good arrangement. The tower is not wanted; but in a general way there is much deserving of commendation in this design. "Vlk" is less successful, and he puts his class-rooms all on one side of the hall. The other designs follow in this order: "Sphylark," "Oak," "Levenach," "Hoopoe," "Tie Beam," "Zox," "First Attempt," "Niche," "Desdichado," and "Clegornie."

#### "ACADEMY ARCHITECTURE."

THE fifteenth volume of this capital quarto publication has just been issued under the directorship of Mr. Alexander Koch, giving selections more or less complete from the architectural drawings and sculpture exhibits in the galleries of the Royal Academy, the Royal

Scottish Academy, and the Glasgow Institute of Fine Arts. Some examples are added from works executed from abroad; but on this occasion the foreign architectural designs hitherto forming so prominent a feature in "Academy Architecture" have been omitted. The pressure of British contributions probably accounts for this, and in the second volume to be issued towards the end of the year it is likely that the Continental illustrations will be included. To give an idea of the manner in which the editor reproduces the sculptured works in his well-printed pages we have, with his permission, made a choice of three of his full-page blocks, and these are given with our present little notice. The two more striking statues are from the monument to the Bourgmestre J. Anspach by the sculptor, M. Julien Dillens, of Brussels. These decorative and spirited figures represent "Literature" and "Fine Art," and may be taken as very obviously typical of Belgian sculpture of to-day, extremely clever and very free, with the draperies studied to give point and shadow, while no attention to technique is spared, so that the extremities of the figures themselves may be as emphatically rendered as possible. In contrast with these we have selected Mr. Alfred Drury's statue of Joseph Priestley, for the City Square, Leeds. This work, shown at the Royal Academy this year, is essentially very different from the Brussels monument, and affords no comparison, of course; but it is the con-

trast which the composition affords which makes all three sculptures the more interesting. It is often, in fact, this element of contrast which gives to a book like Mr. Koch's publication its special value, over and above the record which it makes of contemporary design, by compactly bringing together a variety of subjects garnered very much in a way by the de'ermation of mere chance. This is really the case, because more than often it is by chance principally that works are chosen for exhibition, and then, again, it is largely a chance whether an opportunity can be given for reproducing drawings before they are sent to the various exhibitions. This being the case no collection like that under notice can be said to be complete any more than the exhibitions themselves. Both in their degree are representative in a haphazard way, and the wonder is that Mr. Koch, by industry and forethought, has been enabled to render his pages so comprehensive as they actually are. The success which has attended his endeavours has been the best acknowledgment which he could desire. Many of the illustrations necessarily have already appeared in our own pages, and the same remark equally applies to the Royal Academy Exhibition itself, seeing that we gave a goodly number of the drawings now on view before they were sent to Burlington House.

Among the contributors to the present volume of "Academy Architecture" appear the well-

known names of Messrs. Aston Webb, A.R.A., Ernest George, John Belcher, Fellowes Prynne, W. D. Caröe, Maurice B. Adams, E. W. Mountford, H. T. Hare, Baillie Scott, Ernest Newton, C. F. A. Voysey, L. Stokes, and A. N. Prentice. Many of the illustrations are supplemented by plans, thus increasing their utility.

The Scotch architects chosen for representation include Messrs. George P. K. Young, J. B. Wilson, Washington Browne, A.R.S.A., Dunn, and Findlay, John James Burnet, A.R.S.A., Balfour Paul, Honeyman and Keppie, Thomson and Sandilands, Watson and Salmond, and D. McNaughtan, I.A. Some of the illustrations are lacking titles, which is an oversight very observable by the reader. The catalogue which we have thus given of the names of the more prominent contributors suffices to show how well the character of the publication to which we draw attention has been maintained, in spite of unstinted competition.

#### THE SANITARY INSTITUTE.

THE preliminary programme of the eighteenth congress, to be held in Southampton from August 29th to September 2nd, has now been issued. The president of the congress is Sir W. H. Preece, K.C.B.; F.R.S.; Pres.Inst.C.E. Mr. Malcolm Morris, F.R.C.S. Edin., M.R.C.S.

Eng., will deliver the lecture to the congress, and Bailie J. Dick, J.P., chairman of the Health Committee, Glasgow, will deliver the popular lecture. Excursions to places of interest in connection with sanitation will be arranged for those attending the congress. A conversazione will be given by the mayor (Councillor G. A. E. Hussey).

Over 300 authorities, including several county councils, have already appointed delegates to the congress, and, as there are also over 2,200 members and associates in the Institute, there will probably be a large attendance in addition to the local members of the congress.

In connection with the congress, an exhibition of apparatus and appliances relating to health and domestic use will be held, as a practical illustration of the application and carrying-out of the principles and methods discussed at the meetings; it not only serves this purpose, but also an important one in diffusing sanitary knowledge among a large class who do not attend the other meetings of the congress.

The congress will include three general addresses and lectures. Three sections meeting for two days each, dealing with (1) Sanitary Science and Preventive Medicine, presided over by Sir Joseph Ewart, M.D., F.R.C.P., J.P.; (2) Engineering and Architecture, presided over by James Lemon, M.Inst.C.E., F.R.I.B.A.;

(3) Physics, Chemistry, and Biology, presided over by Prof. Percy F. Frankland, Ph.D., B.Sc., F.R.S. Eight special conferences:—Municipal Representatives, presided over by Ald. T. Walton, J.P., Chairman of the Health Committee, Southampton; Port Sanitary Authorities, Millar Wilkinson, Chairman of Port of London S.A.; Medical Officers of Health, presided over by T. Orme Dudfield, M.D., L.R.C.P., M.R.C.S.; Medical Officers of Schools, C. G. Shelly, M.A., M.D.; Engineers and Surveyors to County and other Sanitary Authorities, presided over by E. Purnell Hooley, Assoc. M.Inst.C.E.; Veterinary Inspectors, W. Hunting, F.R.C.V.S.; Sanitary Inspectors, presided over by C. MacMahon, Chief Sanitary Inspector, Torquay; Domestic Hygiene, presided over by Mrs. Patey.

The local arrangements are in the hands of an influential local committee, presided over by the Mayor of Southampton, with A. Wellesley Harris, M.R.C.S., D.P.H., W. B. G. Bennett, Assoc. M.Inst.C.E., W. Matthews, M.Inst.C.E., and C. H. Russell, M.R.C.S., D.P.H., as honorary secretaries.

#### THE CARPENTERS' COMPANY'S EXAMINATIONS IN CARPENTRY AND JOINERY.

THIS has been a record year in regard both to the numbers attending the series of lectures delivered to candidates previously to the examination, and the number of entries for the examination itself. The lectures are intended primarily for candidates for the carpentry and joinery examination, and although, of course, purely technical, have attracted audiences of over a hundred. The examination took place as usual at the company's hall and at their schools in Great Titchfield-street last week. The number of candidates sitting this year exceeded that of all previous years by at least a third, and the number of successes is more than proportionately higher. The examiners included among their number Sir Alexander Binnie, Professors Banister Fletcher and T. Roger Smith, and Mr. Randall, President of the Institute of Builders. The names of the successful candidates in order of merit are:—

FIRST CLASS.—Wm. Bevan, F. J. Griffiths (silver medals), George Ellis, W. H. Richardson Jones, Jno. Lawrence (bronze medals), W. O. Brown, Arthur Norton, J. E. Painter, J. W. Appleyard, G. H. Griffiths, E. R. Livermore, W. H. Morrish, J. S. Knight, and Tom Pilgrim.

SECOND CLASS.—S. W. Hayward, T. C. Noble, E. W. E. Martin, H. T. Barnes, A. D. Trendall, J. H. Sills, F. Tompkins, F. J. Allman, S. J. Stevens, D. Hunter, E. W. Bell, G. J. Boog, J. R. Heatley, F. Batten, F. C. Brown, A. E. Davis, C. H. Hayward, E. J. Martin, R. H. Griffiths, A. D. White, Thos. Tanton, W. Pither, and J. Perrin.

#### GLASS AS BUILDING MATERIAL.

THE U.S.A. Consul Warner writes from Leipzig:—"Under the name of 'keramo' a new building material, composed principally of glass, and manufactured at Penzig, Silesia, has been placed on the market. As far as known, this material is made from powdered glass waste, which is hardened by a special devitrifying process, and combined by means of strong pressure.

"In this way the transparency, brittleness, and fragility of the glass are destroyed, but other prominent properties—extraordinary hardness, stability against exposure to the weather, non-conduction of heat, non-inflammability, insensibility to oil, grease, acids, &c.—are retained in this new material.

"Keramo can be used for wainscotings in the interior of buildings, for covering floors in houses, kitchens, washing-rooms, verandas, balconies, &c., for rough-casting of walls exposed to the weather, as well as for staircases which are to be fireproof. The colour depends upon the colour of the glass used in the manufacture. The price of keramo is about 6s. 6d. per square yard, and so far the trials which have been made with this product have been most successful."

#### ARCHITECTURAL REGISTRATION IN SOUTH AFRICA.

N Architectural Association is being started at Cape Town under the title of the South African Society of Architects. The objects are to deal with the matter of competitions, which carry most glaring abuses in the colony—more through ignorance than fraudulent intent, it is thought; and to expose the fraud of incompetent

and low-class persons, who, thanks to the liberties permitted to them by the powers that be, and through ignorance or thoughtlessness, are running riot in every centre of South Africa. It is also hoped in due course that the governments will receive a deputation, who will be appointed to negotiate the terms upon which a charter of incorporation will be granted, to be followed by the licensing of only competent men to practise as architects. Eventually affiliation to the Royal Institute of British Architects, and the holding of local examinations for the association of that body, will be arranged if possible.

The moving spirits are Mr. Arthur H. Reid, F.R.I.B.A., F.S.A., &c., past-President of the South African Association of Engineers, Mr. Henry Baker, A.R.I.B.A., and his partner Mr. Masey; Mr. C. H. Smith, A.R.I.B.A., Mr. Ackermann, A.M.I.C.E., &c., Messrs. John Parker, J.C. Tully, A.R.I.B.A., Vixie, Boxe, and others are to be invited to join the movement. We heartily wish it success, and only regret that the Institute is not yet prepared to take similar action. All our colonies will have Architectural Registration apparently before we get it here at home.

#### THE DISPUTE IN THE BUILDING TRADE.

A MEETING of representatives of trade-unions in the building trade was held on Monday at Manchester. The draft of a "basis of settlement" to be considered at a joint conference between the National Association of Master Builders and the representatives of the trade-unions, which had been submitted to the executive committees of the trade-unions, was approved and has been forwarded to the secretary of the Master Builders' Association.

There is every reason why the employers should accept the basis proposed. The men offer a tribunal for each district to discuss the points of controversy that have arisen or may arise, with a central or national board to act as a court of appeal. The proposal is very much what the Engineering Employers' Federation instituted as the result of the great dispute in that trade, and it is impossible that the master builders could dictate better terms, even after a successful lock-out of many months' duration. The only practical obstacle is the attitude of the Yorkshire employers. The point at issue between the Yorkshire employers and the men is whether a sectional or a national conference is to be held. On this point we believe the majority of employers agree with us, that the men are right in wishing that the settlement should be national. If the Yorkshire employers do not assent to this view, the National Association should submit the matter to a third party acceptable to both sides.

#### CHIPS.

The rural district council of Wirral have raised the salary of their surveyor, Mr. Hughes, from £120 to £170 a year.

The east window in St. Giles's Church, Cambridge, has been filled with stained glass representing our Lord in Glory adored by angels and by St. Peter and St. Giles. The artist was Mr. C. E. Kempe.

The Martyrs' Memorial at Canterbury was inaugurated last week. It is of grey Cornish granite, and consists of a square pedestal on a rock base, from which rises a shaft 13ft. in height, surmounted by a reproduction of the ancient Canterbury cross. This round form of cross was taken from a cross of bronze gilt, discovered some thirty years since in the course of drainage excavations in the main thoroughfare of Canterbury.

The opening of the new buildings of King's College School at Wimbledon will be performed by the Duke of Cambridge on Thursday, July 6, at 3 p.m.

The rural district council of Truro have elected Mr. John Retallack, of Perranzabuloe, as highway surveyor for the northern district, which comprises eight parishes with about 230 miles of roads. The surveyor will have to devote the whole of his time to the duties, to keep a horse, and reside in a central place in the district. The salary is £145 per annum (to include all travelling expenses).

The Mersey Docks and Harbour Board intend to deepen the Alfred 100ft. lock at Birkenhead from 12ft. to 17ft. below the old dock sill, to alter the sills of the Alfred Dock Inner 100ft. passage, and the Morpeth Dock west passage, and to provide additional pumping machinery at the Wallasey Dock. The estimated cost of this work is £51,000. It is stated that a further expenditure of £24,000 will be needed to complete the work.

#### PROFESSIONAL AND TRADE SOCIETIES.

INSTITUTE OF SANITARY ENGINEERS.—At the half-yearly general meeting, held on the 15th inst., the following resolutions were unanimously carried:—1. That the minutes of the meeting held December 15th, 1898, be confirmed. 2. That the balance sheet and reports of the governing body and auditor for 1898 as presented be adopted. 3. That, in addition to the present classes of Fellows and Associates, a class of Members be established. 4. That for all Fellows, Members, or Associates joining after June 30th, 1899, the entrance fees and annual subscriptions be uniform, irrespective of locality, as follows, viz.:—Entrance fees: Fellows, £2 2s; Members, £1 11s. 6d.; Associates, £1 1s. Annual subscriptions: Fellows, £2 2s.; Members, £1 11s. 6d.; Associates, £1 1s. 5. That all belonging to or joining the institute during the present year, whether Fellows, Members, or Associates, have the privilege of becoming life Fellows, life Members, or life Associates, on the payment of ten guineas—five guineas before the end of the present month, or, in the case of new Members, within fourteen days of receiving notice of election, and five guineas on or before January 1st, 1900. Life Members to be exempt from all further calls for subscriptions during their membership. The fees for life Members after the expiration of the present year to be as follows, viz.:—Life Fellows, 20 guineas; life Members, 15 guineas; life Associates, 10 guineas.

NATIONAL ASSOCIATION OF MASTER BUILDERS.—Arrangements are being pushed forward by the Plymouth Master Builders' Association in view of the visit, next month, of the representatives of the National Association. Most of the visitors will arrive in Plymouth on Tuesday, the 18th prox. The council of the National Association will meet on the morning of the 19th, and the general meeting will take place in the afternoon. In the evening the representatives will be entertained at a banquet in the Guildhall. The next day, Thursday, the 20th, will be devoted to pleasure. A large party of ladies and gentlemen will proceed to Princetown by train, and drive to Tavistock, where lunch will be served. Subsequently the drive will be continued to Morwelham, and thence all will return to Plymouth by the s.s. *Princess Royal*. The Mayor is giving a reception in the evening, and on the following day Sir John Jackson has consented to the visitors being shown over the Extension Works at Keyham. The local committee, of which Mr. W. G. Laphorn is chairman, is doing all in its power to make the first visit of the National Association to Plymouth an enjoyable one.

QUATUOR CORONATI.—The society known as "Quatuor Coronati" held its annual meeting and excursion this year at Exeter. The members, numbering over 150, on the 16th inst. visited the cathedral, where a very interesting lecture was given by Canon Edwards. At the Guildhall the town clerk, Mr. Short, took the party in hand, and first gave an address on the early history of Exeter, showing various treasures and ancient documents; then to Rougemont Castle, Wynard's almshouses, the church of St. Pancras on the site of a Celtic church, the Mint and Priory, and Moll's Coffee House. On the following day the party proceeded by special train to Bovey Tracy, and eight coaches conveyed them across Dartmoor. Local members explained the various objects *en route*, especially the hut circles, the lofty hills, and at the stone avenues and hut circles near Princetown Mr. Worth, C.E., of Plymouth, delivered a most interesting address on the prehistoric remains on the Moor. The interesting church of Widecombe was visited, and the Church House, erected late in the 15th century. The church is much too large for the population, not a fourth of the space being occupied on Sundays. At the west end there is a board on which is inscribed a quaint account of a great storm in 1638. The very long drive was finished at Tavistock, where a special train awaited them, and conveyed them to Exeter. Members present not known to our readers were Messrs. C. Purdon Clarke, F.S.A., F. A. Powell, J. William Stevens, Henry Lovegrove, and others.

Extensive alterations are about to be carried out at the workhouse at Cheadle, including new drainage works and the addition of an infirmary and laundry. The architect is Mr. J. T. Snape, of Newcastle-under-Lyme.

## Building Intelligence.

**BALSALL HEATH.**—The foundation-stone of the new Church of St. Barnabas was laid in Ladypool-road on the 14th inst. At present it is only intended to erect the chancel, organ-chamber, and vestries; but when funds permit the church will consist, in addition, of a wide nave, aisles, transepts, and morning chapel, and accommodation will be provided for about 900 worshippers. There is to be a tower at the corner of Ladypool-road and Clifton-road. At the west end will be a projecting octagonal baptistry, over which will be a group of lofty traceried windows. The south side will show a range of traceried clerestory windows and buttresses. The building both inside and outside will be of red brick, with moulded terracotta tracery, and will be covered with an open timber roof and green slates. The architect is Mr. T. F. Proud, of Erdington, and the builders are Messrs. E. Giles and Son, Camp Hill, Birmingham.

**BIRMINGHAM.**—On the site till recently occupied by Christ Church, having an area of 2,475 square yards, and bounded by New-street, Paradise-street, Colmore-row, Waterloo-street, and Christ Church-passage, is about to be covered by blocks of business premises. The contract for the first portion of the building—about one half of the entire structure—having frontage to Colmore-row and Waterloo-street, has been taken by Messrs. J. Barnsley and Sons at about £50,000. The scheme consists of three distinct blocks of buildings. The ground-floor treatment will be suitable for shops, insurance, and professional purposes, and the upper floors, of which there are four, will be devoted to professional offices. Each shop will be provided with basements and sub-basements, lit by pavement lights. There will be six suites of rooms on the ground floor in Christ Church-passage, and over the shops ninety-four offices. The exterior design will be in a Free Renaissance style of architecture, relieved with ornamental windows, perforated balconies, arcaded stories, and stone dormer windows. The stonework to the top of the shops will be of Darley Dale, with red granite pilasters, and the remainder of the frontage will be executed in Bath stone from the Monks Park Quarries. The circular front facing Paradise-street will be surmounted by a dome, and stone bay windows will also be largely used in the principal elevations. The entire work will be carried out under the superintendence of Messrs. Essex, Nicol, and Goodman, architects, New-hall-street. A meeting of the Improvement Committee of the city council was held on Friday, when the tenders for the erection of working-men's dwellings in Milk-street were considered. The scheme adopted by the council was for the erection of six blocks of buildings containing sixty-one tenements, on the dual system, at an estimated cost of £10,100. Fifteen tenders were sent in, and the lowest, that of Messrs. B. Whitehouse and Sons, Monument-road, was accepted.

**DUDLEY.**—The new grammar school in St. James's-road was opened by the Countess of Dudley last week. The buildings, which have cost £6,750, consist of a school to accommodate 160 scholars and a headmaster's house. The style adopted for both blocks of building is Tudor Gothic. Externally each structure is faced with red Ruabon bricks and terracotta dressings, and roofed with brindled Staffordshire tiles. Internally the joinery throughout has been executed in New Zealand "kauri" wood, stained and varnished. The school building contains five classrooms and a central hall, the capacity of the latter being 56ft. by 28ft., and having seating accommodation for 250 adults inclusive of scholars. The central hall has a high panelled dado; and over a fireplace, carved in oak, is the borough coat of arms. In addition there are a chemical lecture theatre, laboratory, &c., which are separated from the school by a covered passage, and can be entered direct from the playground. The lecture-theatre will seat thirty-six students, and the chemical laboratory sixteen. The basement also contains heating-chamber, cooking-kitchen, and mess-room, adjoining which is a partly-covered playground. The building contract has been carried out by Messrs. Webb and Round, of Dudley, to the plans of Messrs. Woodhouse and Willoughby, of Manchester, whose designs were accepted in an open competition, in connection with which fifty-four sets were sent in.

**HAWKESYARD, RUGELEY.**—The new Dominican Priory Church was consecrated by Bishop Ilsey last week. The style of the new church is Late Perpendicular, red bricks being used, with dressings of Penkridge stone. The internal dimensions are—length 120ft., width 30ft., height 54ft. The main entrance is deeply recessed and moulded, and above it is a traceried seven-light window. The organ-case, designed by Wren and originally erected at Eton, is a beautiful example of the Renaissance style. On the right of the west entrance is a moulded arch, opening into a chantry chapel. The lady chapel is on the opposite side and occupies the space of two bays. The roof is panelled in wood, and the altar and reredos are of stone. The architect of the church and the adjoining priory is Mr. E. Goldie, of London.

**MAIDSTONE.**—The new Victoria Free Library in Faith-street constitutes a memorial of the Diamond Jubilee. It occupies the site of the old curator's residence next the Museum, and between that institution and the New Technical School. A new curator's house has also been built. The new erections are in the Elizabethan style of architecture, corresponding with the museum. The free library is 54ft. in length and 21ft. wide, with a moulded and panelled plaster ceiling. It is proposed to divide the room by screens and fittings for the purpose of the lending-library and reading-room. An upper apartment of like dimensions styled the County Room, is intended for the exhibition of special collections particularly interesting to the people of Kent. The floor space of this room will be entirely unobstructed, and a narrow and light iron gallery, suspended from the open pitch-pine roof, renders the whole of the wall space available for the fixing of cases containing exhibits. The new rooms communicate by folding-doors with the lower and upper halls of the School of Science and Art on the one hand, and with the ethnographical and fine art rooms of the museum on the other. A small work-room has been provided on the upper floor. There is also a basement for the storage of newspapers, &c. The curator's residence occupies the site opposite the free library, and with the latter the technical school forms a new forecourt, 30ft. wide and receding 38ft. from Faith-street. The cost of the library and the curator's house has been £3,600. Mr. A. W. Smith, F.R.I.B.A., is the architect, and Mr. W. J. Logan the builder. The library will be formally opened to-day (Friday) by the Lord Mayor of London.

**SHEFFIELD.**—The old Athenæum in George-street is now in course of demolition, preparatory to rebuilding on a much enlarged site. There will be a frontage to George-street of 125ft. The building is of brick with stone dressings, and mullioned and casemented bay windows. The central entrance will lead into an outer porch 9ft. square, with porters' offices on either side, opening into an inner hall, 15ft. wide, with staircase beyond. The whole of the basement will be let off. Messrs. Flockton, Gibbs, and Flockton, of Sheffield, are the architects.

**SOUTH KENSINGTON.**—The Prince of Wales will lay to-day (Friday) the foundation-stone of the new buildings for the Royal School of Art Needlework. The site is at the corner of Imperial Institute-road and of Exhibition-road, and the buildings, which will cost about £34,000, will extend 150ft. along the former road, and 120ft. along the latter. In addition to 18 or 20 classrooms, and a workroom extending the whole front of the building on the Imperial Institute side, with a width of 30ft., there will be some extensive show-rooms, the largest of which will be available for exhibition purposes, and also a lecture and committee room. The general plan of the buildings is that of a quadrangle with two courts. The basement story will be of Portland stone, the principal story of red brick with stone dressings, and the upper floor of stone, while at the corners will be pavilions, surmounted by domed roofs. The architect is Mr. F. B. Wade, of Sloane-street.

**WALLASEY.**—The memorial-stone of a Presbyterian Church of England was laid in Village-road on Saturday. The building will consist of nave and transepts, organ-apse, minister's vestry, ladies' retiring-room, &c., and a west gallery can be erected at a future period if necessary. The style adopted is Early Gothic. The building will be faced on all sides with Ruabon brick, the dressings and tracery, strings, and weatherings being of terracotta. The windows will be glazed with cathedral glass, the internal fittings and

pew framing being of varnished pitch pine, and the roofs will be covered with Ruabon red tiles. The heating will be hot-water pipes. According to the present part of the building schemes there will be accommodation for about 450 worshippers. The estimated cost is about £4,000, including the sum which was paid for the site. The architect is Mr. A. W. Smith, Manchester, and the contractor Mr. W. H. Forde, Birkenhead.

**WESTMINSTER CATHEDRAL.**—Progress is steadily being made on Mr. J. F. Bentley's Roman Catholic basilica near Victoria-street. Besides the centring of the monks' choir, that is to carry the dome and pendentives which span the square formed by the intersection of the transept with the nave, rests have been placed in position for laying the mass of concrete of the dome, as well as that of the vault and apse beyond, while some of the small vaults at the west end are complete. The centring of the sanctuary dome and pendentives is also far advanced. The brick and stonework are now carried up to their full height, and it only remains to finish the various turrets, when the external scaffolding will be struck and the brickwork pointed as it descends. The terracotta trellises that will fill in the large semicircular windows of the clerestory and elsewhere are in the hands of the potter, and a sample of the work already fills the upper window of the baptistry.

### CHIPS.

A service for the dedication of the tower and spire and other additions made to Craiglockhart Parish Church was held in the church on Friday.

Under the will of Mr. Myles Birket Foster, of Braeside, Weybridge, a member of the Royal Society of Painters in Water Colours, personal estate is left of the value of £30,391 13s. 7d.

The seventh of the eight works promised by different donors for the mural decoration of the Royal Exchange was placed into position on Monday. The subject of the latest canvas is an historical one, depicting "The Opening of the First Royal Exchange by Queen Elizabeth." The artist is Mr. Ernest Crofts, R.A., and it is the gift of the Mercers' Company. This picture, like the others, is painted in the new medium, "spirit fresco," invented by Messrs. Charles Roberson and Co.

The Chesterton Rural Sanitary Authority have adopted plans, prepared by Mr. Wood, C.E., for the sewerage of the St. John's and Brookfield districts of Charrington, the estimated outlay being £7,000.

Extensive works are in progress by the London and South-Western Railway Company at St. Denys, Southampton. At present the whole of the traffic, main line and to Portsmouth, passes through the station, but the alterations will result in the Netley trains passing over a new set of rails, east of the present lines, and through a new station, which, although connected with the old one by an extension of the passenger bridge, will be a separate one, with a complete set of offices and waiting-rooms.

The parish church of St. Mary, Stratford, Bow, was reopened last week, after having been closed for upwards of two years. In October, 1895, a portion of the chancel roof subsided, and it was then found that the whole church was practically tumbling down. Consequently it had to be closed. A new roof has now been provided to the nave, while the gable roof of 1755 has practically been renewed. The brick gable has been rebuilt, but the old timbers have been left. The tower is now the only part of the church to be repaired, and before that can be done a sum of about £1,800 must be collected. Messrs. W. A. Hills and Son were the architects for the restoration.

The Dean of Norwich, Dr. Lefroy, has written an exhaustive letter to the local Press, in which he sets forth the acoustic and architectural considerations which make it desirable, in his judgment, to erect the new cathedral organ on Lyhart's screen, which spans the nave, and quoting the opinion of Sir Walter Parratt, Sir J. F. Bridge, Sir G. C. Martin, and Professor Mahaffy against using the triforia for such a purpose.

The Chipstead Valley Branch Railway, which has just become the sole possession of the South-Eastern Company, will eventually enable the latter company to become a formidable rival to the Brighton Company for the racing traffic to Epsom Downs. At present the line is 4½ miles in length, and extends from a junction at Purley in a south-westerly direction by Chipstead to Kingsdown; but it is to be carried, by a sharp north-west curve, another 2½ miles to Tattenham Corner, where a site of 28 acres has been acquired, facing the junction of the long, five-furlong, and straight courses. Mr. A. J. Barry is the engineer, and Messrs. Bott and Lewis Jones are the contractors, Mr. Hawkins being the contractors' agent.

## Engineering Notes.

**COLWYN BAY.**—The first pile was driven on Monday for the new Victoria pier. The work is being carried out from designs of Messrs. Mangnall and Littlewoods, Manchester, the Widnes Foundry Company being the contractors for the first section, including the pavilion, which has to be completed by the end of this year. The pier is centrally situated, being adjacent to the station, and commands an extensive view of the bay and the Welsh mountains. The pier promenade leading to the pavilion will be 40ft. wide, and is constructed with iron piles placed at intervals, braced together, supporting steel riveted girders of spans. The pavilion is situate 50 yards from the entrance to the pier on the right-hand side, and has a large dome and campanile towers treated in the Renaissance style. It is calculated to hold about 1,500 persons. On three sides of the pavilion will be a gallery with tiers of seats in front and a promenade behind, two external balconies for promenade purposes are accessible by doors from the gallery. Cloak-rooms and shops are provided. It is intended next year to complete the second section, which will comprise the continuation of the pier to 350 yards in length and 30ft. in width, the extremity being widened out for open-air music and other entertainments. Shops and shelters will be provided at each side, with a band kiosk in the centre, provision being made round three sides of the pier-head for embarking and landing boats. Shelter kiosks will be placed at intervals along the pier. The cost of carrying out the first part of the pier and concert halls will be £31,750.

**WESTGATE-ON-SEA.**—The rebuilding of the sea-wall is now completed. In the winter of 1897, during the storm which created so much havoc and damage both at Margate and Herne Bay, nearly the whole of the sea-wall and front promenade at Westgate were swept away, leaving the cliffs for the greater part of the distance bare. Immediate steps were taken to protect what little of the sea-wall and promenade remained, and in the early part of 1898 arrangements were made for the reconstruction of the destroyed portion, which extended along the whole front of St. Mildred's Bay. The wall and approaches have been built, the backing filled in, and the promenade has now been tar-asphalted from end to end. In rebuilding great improvements have been made. A wall has been built against the cliff to provide shelter seats at intervals along the whole promenade. Approaches from the promenade to the roadway behind—which is a considerable elevation above the sea-wall—have been formed by slopes at an easy gradient, working through the front gardens to the top of the cliff. Step approaches have also been made, and rustic bridges thrown over the various openings. The whole of the outlay has been met by Messrs. Coutts and Co., the owners of the estate. The design and execution were the work of Messrs. A. McIntosh Valon and Son, engineers, 140, Temple Chambers, Temple-avenue, E.C. Mr. William A. McIntosh Valon (consulting engineer to the corporation of Ramsgate) is advising engineer to Messrs. Coutts and Co., and is also engineer and has charge of the gas and water works which supply Westgate-on-Sea, Birchington-on-Sea, and district.

At a special meeting of the Croydon County Council on Monday it was resolved to purchase by agreement the undertaking of the Croydon Tramways Company for the sum of £50,000.

It was reported at a meeting of the town council of Aberdeen on Tuesday that negotiations had been completed with the City of Aberdeen Land Association for the formation of a street which will form part of a boulevard, which is intended to encircle the city. The street, planted on each side with trees, will be 80ft. in width, a mile long, and cost £7,200. The whole boulevard scheme will probably cost £20,000.

A question as to whether the National Telephone Company, in proposing to lay wires under a license from the Postmaster General, had to obtain the consent of a tramway company as well as that of the local authority for breaking up the streets, was before Mr. Justice North in the Chancery Division on Tuesday. The Bristol Tramway Company contended that they should have been asked to agree to the laying of the wires; but the Judge held that the Acts of Parliament under which the defendants proceeded did not apply to tramway companies, and dismissed the action, with costs.

## COMPETITIONS.

**DOVER.**—In the recent competition for designs for a concert pavilion to be erected on Dover Promenade Pier, the directors have selected the joint design of Mr. Noel Ridley, A.M.I.C.E., and Robt. J. Beale, A.R.I.B.A., of Westminster. The directors have also adopted a report by the same authors on the strengthening of the pier, and given instructions for the working drawings, &c., to be at once proceeded with.

**MENSTON.**—The secretary to the Wharfedale Union Joint Isolation Hospital Committee has issued a circular stating that in consequence of the very numerous applications for plans of the proposed hospital buildings to be erected at Manstone, it has been decided by the building committee to require a deposit of the sum of one guinea before the plan of the site is issued, which sum will be returned on receipt of a set of *bond-fide* plans for the required buildings. This, although far from being uncommon, is an unjustifiable proceeding, as it is improbable that any architect would apply for particulars unless he proposed to compete, provided the conditions were satisfactory. To demand the temporary deposit of a guinea puts the committee and each competitor to unnecessary trouble and inconvenience. If it is desired to limit the number of plans sent in, why should not the committee invite a few architects of reputation to send in plans, paying each selected competitor an honorarium as some sort of compensation? The cost is limited to £275 per bed inclusive, and for preparing plans for an institution of about six-and-forty beds for patients, besides an administrative block and provision for future extensions, the paltry premiums of £30 and £1 are offered for the selected designs, which are to become the property of the committee. Further comment is needless.

**SEACOMBE.**—In a recent limited competition for a Congregational church to be built at Seacombe, Birkenhead, at a cost of £2,700, the plans of Mr. F. W. Dixon, of Trevelyan Buildings, Manchester, have been accepted, and he has been instructed to proceed with the work at once.

## CHIPS.

A Local Government Board inquiry was held at the Dukinfield Urban District Council offices on Friday by Colonel Luard, in regard to an application of the District Council to borrow about £12,000 principally for the erection of a new town-hall, a small portion being for sewerage. There was no opposition.

Sir Courtenay Boyle presided over a sitting at the Board of Trade on Monday, to consider an order by the Light Railway Commissioners authorising the construction of a short line of light railway from Corringham, Essex, on the Thames, to Kynochtown, mainly for the convenience of the workpeople employed in Kynoch's factory. The scheme is promoted by the Kynoch Company, no objections were taken to it, and the order was passed.

A new organ, which has been erected at St. Anne's Church, Stanley, Liverpool, by Messrs. Richard Tubb and Sons, of Liverpool, will be opened on Sunday next.

Owing to the continued ill-health of Mr. Farrington, the engineer and surveyor to the town council Conway, he has been appointed consulting engineer, and the council have decided to advertise for a successor as surveyor at £150 a year.

An anonymous donor has promised £3,500 for the purpose of erecting a Municipal Museum and Art Gallery adjoining the Central Free Public Library at Hampstead. The library was erected in 1897 by Sir Henry Harben, the chairman of the Hampstead Vestry, at a cost of over £5,000.

A petition has been lodged in the Registry Office of the Diocese of London against the application for a faculty authorising the vicar and churchwardens of St. Dunstan's, Fleet-street, to sell the western open frontage to the Law Life Assurance Co., Ltd., and to devote the proceedings of the sale (£4,600) to the erection of a rector's house on the eastern open frontage of the church. The petition is numerously signed, and the matter will be probably carried before the Ecclesiastical Court.

The Society of Arts has recently caused tablets to be erected on the following houses, to mark the former residences of distinguished persons:—"Belmont," Rosslyn Hill, Hampstead, formerly the residence of Sir Harry Vane; No. 50, Wimpole-street, where Mrs. Elizabeth Barrett Browning, wife of Robert Browning, the poet, lived for some time, and from which house she was married. The Society has also decided to erect a tablet on "Bolton House," Windmill Hill, for many years the residence of Joanna Baillie, the dramatist.

## WATER SUPPLY AND SANITARY MATTERS.

**CORLEY.**—The newly constructed works of the North Warwickshire Water Company at Corley, near Foleshill, were opened last week. The well at Corley, of 10ft. diameter, is sunk to a depth of nearly 100ft., and beyond this a bore-hole has been carried down 150ft. A couple of adits have also been cut, by which means the supply of water has been largely increased. A yield of about 250,000 gallons per day can be relied upon. The company's district of supply includes about 16,000 people, but many are not likely for many years to come within the limits of the supply. In addition to the Corley boring, the company are sinking another well at Keresley. The company have constructed a small temporary reservoir to hold about 50,000 gallons, and the accommodation will be increased to a million gallons. The temporary reservoir is situated at a height of about 450ft. above the sea level, while the highest point in the district of supply is not more than 343ft. Mr. J. A. Quick, M.Inst.C.E., was the engineer, and Mr. A. E. Nunn, of Tenterden, the contractor.

**DRONFIELD.**—The new sewage disposal works of the Dronfield Urban District Council recently opened have been completed in accordance with the designs of the council's engineer, Mr. G. White, C.E., of Mexborough, and are on the International system, comprising circular upward flow tanks, with automatic sludge or detritus removal apparatus, clarifiers, and polarite oxidising filter-beds—now popularly termed bacteria beds. The contractors were Messrs. Margerrison and Sons, of Dronfield.

**GREAT AYTON.**—The main sewerage and sewage disposal works for Great Ayton, near Middlesbrough, have just been finished. About three miles of sewers were laid, part of them being in very wet and unstable ground. Continuous steam pumping was also necessary in sinking the shaft for the precipitation tank, the bottom being over 28ft. below the normal subsoil water level. The purification of the sewage will be effected by chemical precipitation in a deep vertical tank, the effluent from which is distributed over land on the ridge and furrow system. The contract was let to Messrs. Cruddas and Son, of Guisborough. The total amount of contract is about £4,000. Mr. Harry W. Taylor, A.M.I.C.E., of Newcastle and London, is the engineer, having won the scheme in open competition about three years ago.

The town council of Plymouth have resolved to engage Mr. H. T. Buckland, of Birmingham, to superintend the execution of his selected design in connection with the buildings to be erected in Tavistock-road, and to supply tracings of plans, &c., for the purpose of builders at a fee of four guineas per site. The town council have also instructed Mr. H. J. Snell to prepare and submit rough sketch plans for providing slaughter-houses and ancillary accommodation at Prince Rock, and also an estimate of the cost, which is not to exceed £5,000 exclusive of the cost of the land.

The Archbishop of Canterbury visited Lancing College, Sussex, last week, on the occasion of the college jubilee and the opening of the new chapel. The chapel is a building of cathedral proportions, though not yet completed. It is in the Early Geometric style. Its internal length is 180ft., the width being 64ft., and the height to the groining 90ft. The ante-chapel will be 48ft. long, 64ft. wide, and about 80ft. high; and on the north side the great tower has been commenced. Beneath the upper chapel is the crypt, which is one of the longest in England.

The Salford Corporation have agreed to purchase, on a 999 years lease, 17½ acres of land on the Crowcroft estate, Longsight, as a public park.

The ceremony of dedicating the newly-erected tower which has been erected as an addition to the Roman Catholic Church of St. Michael's, Aston, near Stone, Staffordshire, was performed on Friday.

At Kirkcaldy, on Saturday, a new infectious diseases hospital, built at a cost of £10,000, was formally opened.

A provincial meeting of the Society of Architects will be held in the Board-room of the Cutlers' Hall, Sheffield, on Friday evening next, at 6.30 p.m., when a paper on "The Statutory Registration of the Profession" will be read by Mr. Ellis Marsland, hon. sec., and a resolution will be proposed.

Tuesday next, the 27th inst., has been fixed for the annual excursion of the Bristol Master Builders' Association, and the visit will be to Bridgwater and the Quantocks. Buses will be in waiting at Bridgwater at 9.47 to convey the party through Spaxton, Cockercombe, Triscombe, Stone, round Danesboro' Hill to Castle Comfort. Luncheon will be provided at Holford, and after a visit to Holford Glen the return will be via Nether Stowey, Keen-thorne, Cannington, and Wembdon. Dinner will be served at the Bristol Arms, Bridgwater.

NEW SAVINGS BANK, KENSINGTON—UNION CHURCH, QUEEN  
SQUARE, BRIGHTON—STAR ASSURANCE OFFICES, BRISTOL  
—DESIGNS FOR SMALL PARISH SCHOOLS.

## Our Illustrations.

THE POST OFFICE SAVINGS BANK, KENSINGTON.

The Prince of Wales will, on behalf of the Queen, lay the foundation-stone of this great pile of buildings to-morrow (Saturday), with State ceremonial. The cost of the new Savings Bank will be about a quarter of a million. Attached to the main premises a regular post office will be erected, chiefly intended to assist in the working of the Savings Bank Department, in which several thousand clerks will be employed. The plan, given with the view and drawing of the front elevation, will show how the building is arranged, with all the sanitary provisions well isolated from the official departments, and cleverly concentrated. Next week we may be enabled to give a description of the building more in detail. Mr. Henry Tanner, F.R.I.B.A., of H.M. Office of Works, is the architect.

UNION CHURCH, QUEEN SQUARE, BRIGHTON.

The two drawings reproduced to-day are at the Royal Academy this year. From the same exhibition we published the exterior view and plan of the same building on May 5 last. The present double-page perspective shows the interior of the chapel, which is admirably adapted as an auditorium with three galleries in the apsidal-ended transepts, and the rostrum facing the audience. Ample light is afforded by the arched windows at the base of the dome and the lunettes over. Every seat-holder will obtain a view of the preacher, and the building has the distinct advantage of avoiding any attempt to imitate an ecclesiastical place of worship, wherein the altar necessarily determines a different aim, and imposes an essentially diverse arrangement. The result thus obtained is far more correct architecturally, and the proprietors have done well in allowing their architect, Mr. John W. Simpson, to plan a preaching-hall pure and simple. The second plate shows the group as it will appear from the end of the Western-road.

THE STAR LIFE ASSURANCE OFFICES, BRISTOL.

This building is about to be erected in Bristol as a branch office for the Star Life Assurance Society, London. The site which has been acquired forms part of St. Augustine's Parade, which, until a few years ago, was only accessible from a part of Bristol by means of a drawbridge over the then-existing harbour. This harbour has been filled in, and a portion of it has been laid out as a public garden, the remainder forming a wide open space, which is now the tramway centre of Bristol. The premises comprise shops on the ground-floor, with extensive offices over, which are so arranged as to be easily divided into suites of any required number of rooms. There is a lift to all floors. The whole of the front is to be executed in Ham Hill stone, the

roofs being of slate. The work is being carried out from the designs, and under the superintendence, of the architect, Mr. Arthur Blomfield Jackson, Mecklenburgh-square, London.

"BUILDING NEWS" DESIGNING CLUB: A SMALL PARISH SCHOOL.

(For description and awards see p. 835.)

## CHIPS.

In the list of tenders published last week we gave those for the enlargement of the Baptist Church Sunday-schools, Swadincote, but omitted the name of the architect, Mr. C. F. Underhill, of Burton-on-Trent.

The new church of St. Aidan's, Middlesbrough, was dedicated by the Archbishop of York on Saturday. The great feature in connection with the erection of the church, which is entirely built of wood, is that it has been built by voluntary workers. The vicar (the Rev. C. H. Sellwood Godwin) having dug the foundations himself, made a special appeal to the people of the town, and at first he was joined by a couple of men. The enthusiasm increased, and within a few weeks ago there were close upon eighty workmen. The whole of the work has been done in the spare time of the men. The edifice is 102ft. by 40ft. and 45ft. in height. There is accommodation for nearly 600 people, and the cost has been between £1,500 and £2,000.

Another step has been taken towards the transformation of the centre of Leeds. The remaining property needed for the construction of the new Cheapside, leading from Briggate into Vicar-lane, has just been acquired by the Leeds Estates Co. by direct purchase from the Pious Use Trustees. Altogether, the company have now paid for properties abutting upon the proposed new street the sum of £190,875, this expense being apart from costs and loss of interests.

A memorial to the late Prebendary Allen, in the form of a stained-glass window, has lately been erected in Christ Church, Eastbourne. The subject of the window is "The Good Shepherd." The canopy and base are examples of perpendicular work. The work has been carried out by Messrs. Jones and Willis.

St. Peter's Presbyterian Church, Upper Tooting, which was dedicated last week, has been built from American designs. The pulpit, with the organ behind, is placed in one of the corners, and the pews being arranged therefrom in concentric lines. The church, which has a gallery, will seat over 700 persons.

Messrs. Kirk and Randall, of Woolwich, have just completed the erection of a large goods warehouse at Broad-street, City, for the London and North-Western Railway Company, from the designs of Mr. Francis Stevenson, chief engineer, Euston Station, assisted by Mr. E. B. Thornhill, with Mr. Keyte as resident engineer. The building covers an area of 50,000sq.ft., and consists of four floors and two basements, and its cost was rather more than £100,000. It is lighted throughout by electricity.

Dr. Tristram, Chancellor of the Diocese of London, gave judgment on Monday on the application of the vicar and churchwardens of St. Botolph, Aldersgate, for a faculty permitting certain alterations in the churchyard. Some time ago, the Chancellor said, the churchyard was laid out as a garden, which was open to the public. Additional ground had since been, by the liberality of the public, added at a cost of £6,000. A wall would have to be erected separating the churchyard from the street, and Mr. G. F. Watts, R.A., had offered to decorate this wall with frescoes delineating acts of heroism that had occurred among the humbler classes. To protect them from exposure to the atmosphere, Mr. Watts proposed at his own cost to construct a covered way, giving free access from the churchyard and grounds. The Chancellor decreed the faculty to issue.

Messrs. Spalding and Cross have dissolved partnership, and Mr. Cross has commenced practice alone in Conduit-street. The work in hand by the firm at the present time will be completed under the joint supervision of the firm, which has terminated by the effluxion of time.

A beginning has been made with the Whitechapel and Bow Junction Railway. The works were started a few days ago at the Whitechapel station under the superintendence of Sir John Wolfe Barry. The line is being promoted by the London and Tilbury Company and the District Company with a view to joining the two systems. It will be some two and a half miles long, and will run from the existing underground line at Whitechapel to Bromley.

The Woburn Sands Board Schools are being warmed and ventilated by means of Shorland's patent Manchester grates and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The new buildings which have recently been completed at the London Hospital Medical College will be opened on Tuesday, July 18, by Viscount Knutsford.

The demolition of the front part of Clarendon Buildings, Lord-street, Liverpool, will begin on July 1, and on August 1 the Countess of Derby will lay the foundation-stone of the first section of the Church-house for the Liverpool diocese. This section will include the main entrance and tower, and the builders' contract is for £13,200. The structure will be of brick and terracotta erected on the frame system. Mr. G. Bradbury, of Liverpool, is the architect.

Business at the Mart during the past week fell away to a considerable extent, and the returns of £145,903 represented sales of property mostly within the Metropolitan area, gas stock and shares in various undertakings, and reversions. The highest amount realised for any single property was £6,300, which was paid for the Theatre Royal, Dover.

Mr. J. Passmore Edwards's home for children at Clacton-on-Sea was opened on Thursday. The institution is for the purpose of providing a seaside holiday home for children, and it is capable of accommodating over 100. In the unavoidable absence of the Earl of Aberdeen, Mr. Passmore Edwards himself declared the home open, and announced another subscription on his part of £1,000. The home has been built from plans by the late Mr. Charles Bell, of Salter's Hall-court, at a cost of £6,700. Messrs. Hammond and Son, of Romford, were the builders. The home was illustrated in the BUILDING NEWS for May 20, 1898.

The partnership hitherto subsisting between E. Tewson, E. Farmer, B. J. Bridgewater, E. A. Tewson, F. B. Debenham, and W. A. Drew, auctioneers, house, land, and estate agents, &c., under the style of Debenham, Tewson, Farmer, and Bridgewater, Cheapside, E.C., has been dissolved so far as regards E. A. Tewson.

Mr. William Wright, of Grantham, has been elected county surveyor of Kesteven, Lincolnshire, in succession to Mr. H. Kirk, resigned. The salary is £220 a year, rising to £250.

A Select Committee of the House of Lords passed on Monday the preamble of the Bill of the London and South-Western Railway Company, which deals principally with the improvement of the company's terminus at Waterloo. Under the scheme, that station will be ultimately expanded on both sides, but the proposed widening on the southern side will be first proceeded with. The capital proposed to be expended under the Bill amounts to nearly £700,000. The persons dispossessed are to be rehoused within a mile of their present abodes, instead of, as usual, within half a mile, and the railway company will, instead of widening York-street, hand over to the County Council a sum of £30,000 to be expended by that body for the purposes of metropolitan improvements within the area affected by the Bill in such a manner as will meet with the approval of the Lambeth Vestry.

At Little Wenlock Parish Church a reading-desk of solid oak has been given as a memorial. It was designed by Mr. W. Arthur Webb, A.R.I.B.A., and executed by Messrs. Jones Brothers, of Wenlock.

The War Office programme of new works contemplated at Pembroke Dock include the erection of a new block of buildings on the south-east corner of Barracks Hill, not far from Wesleyan-row, for the accommodation of married non-commissioned officers and men. Plans and builders' quantities of the new buildings have been prepared, but no tenders have as yet been invited for their erection. The estimated cost of the block is about £7,000. The contract for the erection of the new infantry barracks at Pembroke Dock to supersede the present hut encampment will be let in several sections, the first of which is estimated to cost £38,000.

Plans for the erection of a mission-hall (to accommodate over 500), with a caretaker's house, recreation, and classrooms adjoining, have been recently approved by the Bishop of London's Fund, a site in Allamouth-road, South Hackney, having been given by the committee of the fund to the vicar of the parish (St. Mark's, Victoria Park, N.E.) Mr. Charles E. Hewitt, of 118, Queen's-road, Brighton, is the architect.

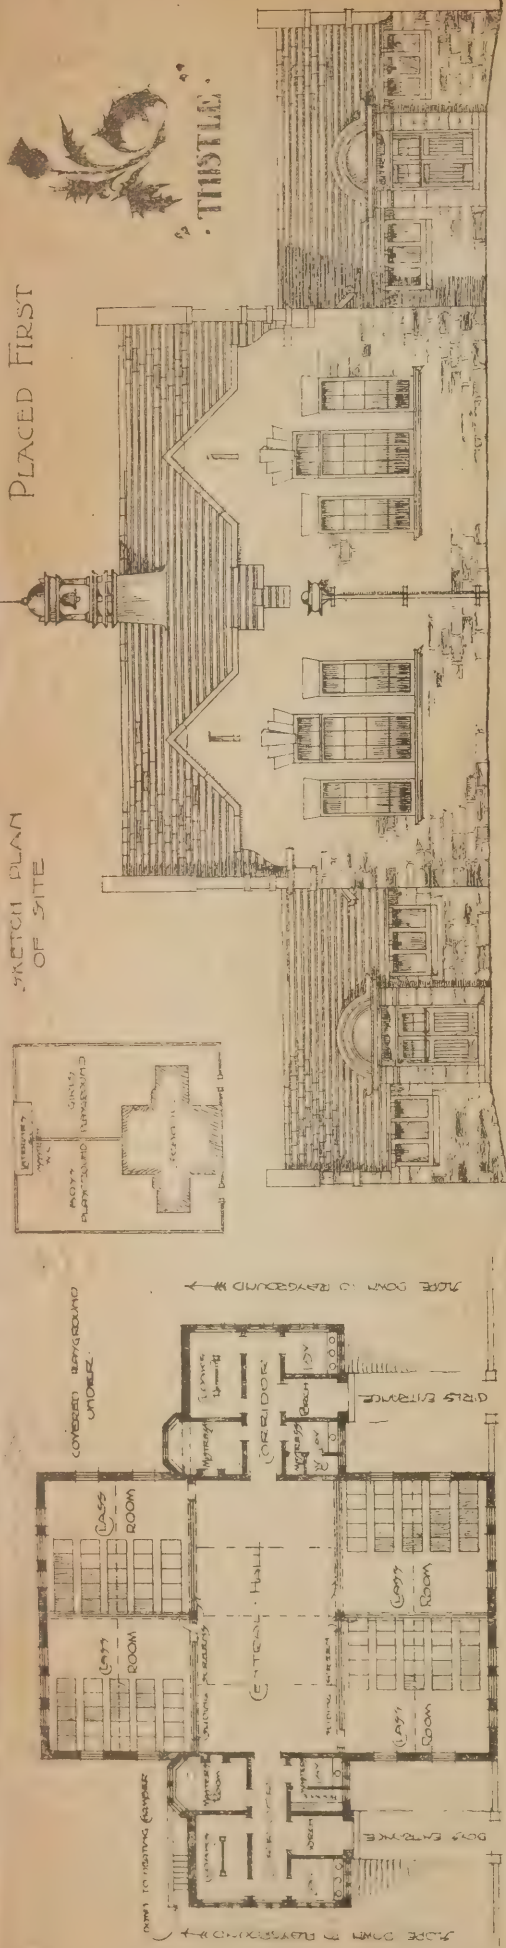

The new premises of the National Telephone Co., Ltd., Belfast, have been fitted with an entirely new installation for the complete warming and ventilation by Messrs. John King, Ltd., engineers, Liverpool, by means of their Rajah ventilating radiators and their patent tubular exhaust ventilators.

New school board offices are being built at Tottenham from the designs of Mr. Thomas E. Murray, architect, Lewisham, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

Mr. G. Wise, chief assistant to the works department of the London County Council, has been elected manager to the West Ham Corporation.

SCALE FOR ELEVATIONS

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLIX., LI., LIII., LIV., LV., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

SALOP.—You need hold no license. Anybody can be an architect at present. Why do not you join either the Institute or the Society, and range yourselves with those who are striving to alter this?

RECEIVED.—S. C. A. (Bradford).—M. B. P. Co.—G. L. S. and Son.—W. R. and Co.—F. K. N.—H. M.

## STENCH-PIPES.

To the Editor of the BUILDING NEWS.

SIR,—It is generally supposed that stench-pipes attached to drains should be carried up 6ft. above the top of the highest window of a house; this, however, does not seem to be the practice here. The stench-pipe attached to the houses occupied by myself and neighbours is carried up only about 1ft. above the eaves of the roof, or a total height from the top of the highest window of only 2ft. Moreover, these pipes have a cowl over them. Now, as the pipes are at the back of the houses, and in a kind of bay formed by the kitchen, scullery, and washhouse jutting out from the back of the dwelling-house, the result is that the sewer-gas as it escapes from the pipe is deflected downwards by the cowl placed on top of the pipe, and, consequently, as there is no escape for it out of the bay except up one end, the sewer-gas is blown into the windows of the back bedrooms and lower rooms of the house that face the bay above referred to. The ultimate consequence is that, when the weather is at all windy, the sewer-gas escapes up the pipe, only, however, to be blown down again into the bay, and thence into the windows of the house, with the result that it is utterly impossible to exclude the sewer-gas whether the windows are open or not. In some houses in the district there is no stench-pipe at all, only one pipe being placed to a block of six or more houses. In a talk I had recently with a prominent builder and district councillor,

that gentleman defended this arrangement on the following grounds—viz., he considered that if a pipe were put to every house in a row of half a dozen, then the gas that escaped from the first one would be very little and hardly perceptible at all; from the next pipe the gas would be a little more and a little stronger, and so on until from the sixth pipe the gas would be six times as much, and as strong as from the first pipe, and, therefore, he considered it not needful to put the first five pipes, only the sixth one, as he considered that that one would perfectly carry off all the sewer-gas from the whole of the six houses. According to this gentleman's theory, five houses should have no stench-pipes at all, only the sixth house. I pity the poor inhabitant of that house! Practically, he has to put up with the stench of his own drain and five of his neighbours. Better, I hold, to have the sewer-gas diluted than to allow it to escape in such concentrated form. Now, what I would suggest is that the stench-pipes be carried up sloping on the roof for five or six feet, or nearly to the ridge tiles, and thus the sewer-gas

will be carried right away from any of the windows. Instead of a cowl a wire netting could be placed at the end of the pipe, so as to prevent birds entering the pipe. What, I ask, is the use of these stench-pipes unless they are efficacious in their duty? Better be without them altogether.—I am, &c.,  
June 5.

H. C. STANDAGE.

## MANOR ASYLUM, EPSOM.

SIR,—In your issue of June 9 you were good enough to give some particulars of the Manor Asylum, Epsom, which has been built to my plans.

You further added that the works of the Horton Main Asylum were in progress, and credited me with being the architect and engineer of that structure; but as this is not so, I should be glad if you would make the correction.

Mr. G. T. Hine, 35, Parliament-street, Westminster, is the architect of the Horton Asylum, which is being built to his plans and under his supervision. Its estimated cost is £350,000, and it will accommodate 2,000 patients. My connection with the work only extends to the engineering section.—I am, &c.,

WM. CHAS. CLIFFORD SMITH,  
Engineer to the Asylums Committee.  
Asylum Committee Office, 6, Waterloo-place, London, S.W., June 20.

[Sorry for the slip, and grateful for the additional particulars.—ED.]

The report of the Thames Conservancy, recently issued, mentions that works between Oxford and Lechlade Bridge have been completed, at a cost of £21,000, which provide a channel along which barges drawing 4ft. of water can pass, and thence through the re-opened Thames and Severn canal, water communication is had with Gloucester and the West of England.

The technical instruction committee of the Manchester Corporation inspected last week the new Technical School which is being built in Sackville and Wentworth-streets at a cost of £130,000. It consists of four stories and a basement, and will be surmounted with an observatory containing a telescope of the value of £1,000, presented by an anonymous donor.

## Intercommunication.

## QUESTIONS.

[12253].—**Breaking Weight of Joists.**—I wish to know the breaking weight in tons of a 9in. by 3in. joist over various spans. I have consulted two books, and from them obtain the following formulae:—

$$(1) L = \frac{12cbd^2}{S}$$

$L$  = breaking weight in tons,  $c$  = coefficient of rupture,  $b$  = thickness of beam,  $d$  = depth of beam,  $S$  = span in inches. My joists are in fir (spruce), and in this case  $c$  = '60 in the table appended.

$$(2) L = \frac{2cbd^2}{S}$$

Here  $c$  = coefficient was given in hundredweights, and equalled 3½.  $S$  was the span in feet. In working out for a 10ft. span, I get by (1) 14 tons as the breaking load, and by (2) 8 tons as the breaking load. It is obvious that there is a vast difference in these two formulae. I should be exceedingly obliged if you would inform me which is the proper one to take. The joists are fixed at both ends, and the load is equally distributed.—W. S.

[12254].—**Echo.**—The minister and others speaking in this chapel complain of the echo, and I should be glad if

some of your readers could give me some particulars to prevent the same. The sketches give the plan and section. The floor is of wood block, walls plastered, and open-timbered roof plastered.—THOS. NUTTALL.

[12255].—**Open Space under London Building Act.**—Section 41 of the London Building Act provides that an open space may be provided above the level of the ceiling of the ground story when the ground story is not adapted for habitation. According to this clause a ground-floor shop may be carried out to the extreme limit of the land or boundary, and without any open space at the back for light and air except a lantern-light. The section as it stands is ambiguous, and ought to be explained by a diagram or section. Will some expert in the matter say whether it is allowable now to extend the ground story of shop to the extreme end of land, or whether the new Building Act does not require the yard at back to be kept open? The section, I take it, applies to premises already built, and when the open space required can only be obtained in the way mentioned.—NOT CLEAR.

[12256].—**Tile-Hanging Wall.**—Are there any tiles that can be recommended for covering a wall outside? They are required to render a thin wall dry, and must, therefore, be impervious. I should be glad to know the best way of hanging, if by battens, and other particulars?—COUNTRY BUILDER.

[12257].—**Colouring Room.**—Will any reader give me any advice as to a suitable scheme of colour for a room with north aspect, cold in winter? The room is about 18ft. by 12ft., and there are two windows on the long side, 11ft. high. Is a frieze necessary?—AMATEUR.

## REPLIES.

[12252].—**Expanded Metal in Plaster.**—The expanded metal certainly increases the strength, and renders fewer supports necessary. It is stated by the Expanded Metal Co., Ltd., that the increase of strength is from 6 to 11 times for concrete slabs. In this case the metal is placed near the bottom surface, and acts so as to resist the tension, thus increasing greatly the strength. In plaster the strength would, of course, be less. Send for particulars to company.—G. H. G.

In the case of the application for discharge from bankruptcy of John Dixon, of Frodsham, Cheshire, builder, the order has been suspended for five years ending May 18, 1904.

On Tuesday week the new church and Sunday-schools, built by the Congregationalists of Morpeth, were opened. They are situated in Dacre-street, Morpeth, are Early English in design, are built from plans by Mr. J. Walton Taylor, F.R.I.B.A., of Newcastle-on-Tyne, and include a church to seat 350 persons, lecture-hall to accommodate 250, large infants' classroom, fitted up with tea-boiler, &c. The cost of the whole, including land, was about £2,700.

## LEGAL INTELLIGENCE.

**DEFECTIVE WALLS.**—At West London Police-court, last week, William Marchmont, a builder, appeared to answer adjourned summonses, taken out for using mortar in the construction of walls of three houses erected in Playfair-street, Fulham Palace-road, not composed of materials required by the by-laws of the London County Council. Mr. F. W. Hamilton, district surveyor for North Fulham, and other expert witnesses were called, and samples of the brickwork and mortar were produced. In support of the case it was stated that the mortar contained 13 per cent. of earthy matter, and out of seven samples only one was found correct. For the defendant it was stated that the walls were well built for that class of work. Several samples taken on behalf of the defendant were described as very fair mortar, with the exception of two, which did not come up to the requirements of the by-law. Mr. Rose came to the conclusion that it was not a case to order the walls to be taken down. Acting upon the candid opinion of the analyst for the defendant that two of the samples did not come up to the requirements, he imposed a penalty of £5, with ten guineas costs. The magistrate expressed an opinion that the County Council were justified in drawing attention to the mortar used in the construction of buildings.

**IN RE G. FORESTER, OF CHESTER.**—Before Mr. E. S. Giles, registrar, George Forester, builder and contractor, lately carrying on business at Boughton, Chester, under the style or firm of George Forester and Son, builder and contractor, recently appeared at the Chester Bankruptcy Court for his public examination. The statement of affairs showed gross liabilities of £3,747 16s. 2d., and, with other amounts, the gross liabilities were placed at £4,314 5s. 8d. There was a deficiency of £3,047 18s., and the alleged causes of failure by the debtor were stated to be "short capital and pressure by creditors." Examined by the Official Receiver, the debtor stated that he was 29 years of age. His father purchased the business premises about 18 years ago, but when his father died he and his brother continued to carry on the business. He was dissatisfied with the manner in which the business was being carried on after his father's death, and a dissolution took place between himself and his brother, and a meeting of creditors was held. The debtor was questioned at great length respecting certain transactions which were made regarding the property and business premises, and the examination was adjourned until the production of further books.

**VOLUNTEER DRILL HALLS AND DRAINAGE REGULATIONS.**—**ST. MARGARET'S AND ST. JOHN'S VESTRIES V. HOSKINS.**—In the Queen's Bench Division on Tuesday, Mr. Justice Grantham and Mr. Justice Lawrence gave judgment in a special case stated by a Metropolitan stipendiary magistrate upon a summons taken out on behalf of the appellants, the united vestries of the two parishes, alleging that the respondent, F. C. Hoskins, a builder, did on March 1, 1899, at 13, Tufton-street, neglect to comply with the order of the vestry ordering that the lowest floor of the building in course of construction be kept at such a level as would allow it to be drained into the public sewer. Mr. Danckwerts appeared for the appellants, Mr. Avory for the respondent. The summons was taken out under Section 75 of the Metropolitan Management Act, 1855. The premises in question consist of a building, in course of construction, to be used as an armoury, storehouse, and drill-hall of the 2nd Volunteer Battalion of the Royal Fusiliers, and are intended for the use of the corps only. The complaint is that the floor of the basement, which is a long cellar running under the building, is beneath the level of the sewer. The magistrate decided that as the premises were to be used exclusively for military purposes the provisions of the Act did not apply to them, and dismissed the summons. The rest of the premises is sufficiently drained. The basement being lower than the sewer, it could not, of course, be drained into the sewer, but it did not appear to the magistrate that it required draining. Mr. Danckwerts said the question was whether the building ought not to comply with the Acts relating to the proper drainage of the Metropolis. Volunteer buildings did not belong to the Crown. He referred to 18 and 19 Vict. c. 120, section 241, and 25 and 26 Vict. c. 102, section 110, but contended that the exemptions therein mentioned did not apply. Mr. Avory supported the decision of the magistrate. This building was vested in a servant of the Crown and for the purposes of the Crown. If this case was decided in favour of the vestry, they would be able to enter and demolish the building. He cited "Pearson v. Holborn Assessment Committee" (1893). The Crown was never bound by an Act of Parliament unless expressly named. The liability must be expressly laid. These premises were in the same position as ordinary barracks. If the vestry were right in this case, the vestry could dictate to the War Office how barracks should be put up. This building had been constructed recently under approval of the War Office. He also cited "Jay v. Hammond." Since

the decision in Pearson's case the Volunteers were as much servants of the Crown as the Militia were. He referred to subsections 240 and 241 of the Metropolitan Management Act, 1855, and section 116 of 25 and 26 Vict. c. 102, under which he urged that this property was exempt from the regulation as to drainage. Mr. Justice Grantham said he regretted that he could not uphold the contention put forward by Mr. Avory, as one had heard of vestries occasionally interfering with such buildings in an unsatisfactory manner. The contention on the part of the Volunteers was based on the analogy of property belonging to the Militia or the Regular Army as being her Majesty's property in right of the Crown. How could it, however, be said that this building and similar buildings, which in many cases were erected by private subscriptions, could be the property of the Crown. On this narrow ground the matter must go back to the magistrate, though the learned Judge would be very sorry if the magistrate should think it necessary under the circumstances to interfere. Mr. Justice Lawrence said he had considerable doubt as to the case, but he was not prepared to dissent. The case, therefore, must go back to the magistrate.

**A CONDEMNATION OF LEICESTER BRICKS.**—At Greenwich Police-court last week, Edward Taylor, of Littleborough, near Manchester, the contractor for the erection of large warehouses for the Mazawattee Tea Company at Hatcham, was summoned by Mr. Tanner, of the London County Council, for contravention of the London Building Act, the contention being that the bricks which were being used were not of the best quality. It was stated that the value of the contract was about £50,000. A great deal of evidence was given on either side as to the quality of bricks, several brickmakers from Leicestershire being called to defend the bricks which were being used. Mr. Tanner declared that the bricks used were "rubbish," and condemned Leicester bricks generally. After a very long hearing, Mr. Kennedy directed the defendant to comply with the Council's order, and to pay 20 guineas costs. Mr. Moyes, for the defence, said the magistrate's decision would have very far-reaching effects, and intimated that an appeal was probable.

**A LADDER NOT "SCAFFOLDING" UNDER THE WORKMEN'S COMPENSATION ACT.**—Sheriff Spens, in a judgment just given, has dealt with several curious points of law under the Workmen's Compensation Act. James McDonald, house painter, 71, Reid-street, Bridgeton, sued Messrs. Hobbs and Samuel, house painters, 70, Anderston Quay, Glasgow, for compensation for serious personal injuries sustained by him while in the defenders' employment. On November 21 last he was engaged painting iron joists in the Dead Meat Market, Moore-street, and was using a ladder while doing so. While he was so employed the occupier of one of the stands in the market close to the ladder swung round the carcass of a bullock for the purpose of showing it to an intending purchaser, and the carcass coming against the ladder, the pursuer was knocked off and fell to the ground, sustaining a fracture of the skull and other serious injury. His Lordship finds that the dead meat market is a building over 30ft. in height; but that, as a matter of law, the said building was not being "repaired by means of scaffolding," and therefore that the accident was one which did not fall within the provisions of the Act. His Lordship in consequence dismisses the claim, awarding no expenses. In a note he says that a ladder must be found to be "scaffolding" before the claim could be sustained. In his view a scaffold was a staging for the temporary use of workmen, and did not include a ladder, which was of a permanent character per se, and not intended to be demolished when the job for which it was used was finished.

**RAILWAY COAL OFFICES AND THE LONDON BUILDING ACT.**—**ELLIOTT AND CO. V. LONDON COUNTY COUNCIL.**—In the Queen's Bench Division, on June 12, Mr. Justice Day and Mr. Justice Lawrence delivered judgment in this special case, stated by Mr. Curtis Bennett, the Metropolitan police magistrate, before whom the appellants were convicted under the London Building Act, 1894, of unlawfully setting up a wooden structure without the license of the London County Council. It was admitted that the structure was a wooden structure, and the only question was whether it came within section 86 of the Act, which exempts from the provisions as to licenses for wooden structures "structures or erections erected or set up upon the premises of any railway company, and used for the purpose of, or in connection with, the traffic of such railway company." The structure in question was put up by the appellants, who are coal merchants in the habit of having coal consigned to them at their wharf in the Carlisle-street coalyard of the Great Central Railway Company, under permission from the railway company and at their own expense. It is occupied by the appellants as a coal office in connection with their wharf for the purpose of receiving and executing orders for, and distributing to small dealers and to consumers, the coal consigned to the appellants at their wharf. It is used solely by, and for the purposes of, the

appellants, and is not used by, or for the purposes of, the railway company. It is convenient to the appellants and to the railway company, for the proper conduct of the business transacted between them in connection with the appellants' share of the coal traffic of the railway company, that the appellants should have in close proximity to the point where the railway company deliver the coal a structure in the nature of an office where they can dispose of their clerical business. It is more convenient for the conduct of the business that such office should be situated on the premises of the railway company and within their coal-yard than outside it. The learned magistrate found that the structure did not come within the words, and was, in point of fact, not used for the purposes of, or in connection with, the traffic of the railway company, and was, therefore, not exempt from the necessity of a license. He convicted the appellant accordingly, subject to the present appeal. The cases of "Cole v. Lovegrove" (L.R. 1893, 2 Q.B. 44) and "Manchester, Sheffield, and Lincolnshire Railway v. Barnsley Union" (67 L. T. 119) were cited in the course of the argument. The Court allowed the appeal. Mr. Justice Day said he had no doubt that the learned magistrate was wrong. In his opinion the structure was "used for the purpose of, or in connection with, the traffic" of the railway company, and was therefore within the exemption. There was no other reason for its existence. Mr. Justice Lawrence delivered judgment to the same effect.

**DAMAGES SOUGHT FOR BLOCKED STREETS.**—In the Court of Appeal, on Wednesday, before Lords Justices A. L. Smith, Rigby, and Vaughan Williams, an appeal was heard, "Martin v. the London County Council," from a judgment of Mr. Justice Kennedy's. The plaintiff and appellant, a greengrocer in Wellington-street, Deptford, had sued the London County Council for damages for injury to his business, alleged to be due to the negligent obstruction of the street by the defendants in the execution of certain works carried out by them under their statutory powers. The jury, at the trial in July and August last, had been unable to agree, and after legal arguments Mr. Justice Kennedy gave judgment for the defendants, on the ground that the plaintiff had not suffered any direct or substantial damage from the alleged obstruction. The plaintiff appealed, but their lordships now dismissed the appeal, and affirmed the finding of the Court below.

## CHIPS.

Mr. W. Matthews, a working mason, has been elected chairman of the Battersea vestry.

A committee of the Corporation of Yarmouth have under consideration a scheme prepared by the borough surveyor for the construction of a railway under the river Yare, between the Fish Wharf, Yarmouth, and Southtown-road, Gorleston. The estimated cost is £15,000.

At St. Bartholomew's, Hyde, Winchester, a new parochial hall was opened last week. It is built in the garden of an old house which abuts on the street, and has in its walls some of the stones from Hyde Abbey, and in its eastern wall is a carved tablet, which is built on to the house wall. The inscription on the stone runs—"William of Wickham built this stone house, Anno Domini, 1586." Beneath are Th. Clerk and some disjointed letters. The William Wickham in question was Bishop of Winchester in 1595, but only held the See for six months, and dying, was buried in St. Saviour's Church, Southwark. The hall has been built from plans by Mr. Ralph Neville, F.S.A., of London, the contractors being Messrs. Edwin Carter and Son, of Winchester.

The council of the Leeds and Yorkshire Architectural Society have passed a resolution approving the action of the Leeds Masters' Federation during the present dispute in the building trade, and stating that they will point out to the general body of the members the desirability of recommending their clients not to put pressure on the masters to fulfil their contracts during the continuance of the dispute, or to let further contracts pending a settlement.

The old house, 7, Johnson's-court, Fleet-street, tenanted by Dr. Johnson from 1766 to 1775, with other houses adjoining, is now being demolished. It was from this house he removed to Bolt-court, where he died in 1784. The housebreakers are also levelling Fetter-lane Congregational Chapel to the ground, and soon not a vestige of it will be left. It was erected in 1732 on the site of the earlier and first chapel built in 1660-61.

With reference to an application for payment of an account, we are informed that as a petition has been presented for winding-up the N.A.P. Window Co., Ltd., the company is advised that no accounts may now be properly paid. Arrangements, we are told, are, however, pending, whereby it is hoped to avert the winding-up of the company.

## Our Office Table.

LORD SALISBURY has declined to reform the Royal Academy on the invitation of Lord Stanley of Alderley. That the Royal Academy needs reformation few will deny. The question is, if the Royal Academicians are unable to reform themselves, is the House of Commons capable of showing them how to set about it? The first thing the House would do would be to refer the matter to a Royal Commission, and what that means Lord Salisbury on Monday hinted to the House of Lords with cynical frankness. A Royal Commission sits for months or years, as the case may be, listens to an enormous amount of evidence, prints it all verbatim at the public expense, and finally publishes a report which members of Parliament receive gratis and sell for waste-paper. Royal Academicians, after all, do nothing quite so stupid as this.

"BEAUTY'S AWAKENING," a masque after the fashion of the old Elizabethan entertainments, written, designed, and presented by members of the Art Workers' Guild, will be performed at the City Guildhall on Thursday evening next, the 20th inst., before the Lord Mayor, the Sheriffs, the Aldermen, and Common Council, and is also to be given to the public on the evenings of Tuesday, Wednesday, and Friday in next week. The book, which is in verse, has been written by Messrs. Walter Crane, Harrison Townsend, H. Wilson, Selwyn Image, C. W. Whall, and C. R. Ashbee. It is an allegory showing the awakening of Beauty and her release from the evil spells of Malebodea (typifying Ugliness) by Trueheart the Seeker, who stands for Art. The nine fair cities of the world appear in pageant, as does also London attended by eight demons, including Philistinus, Cupiditas, and Ignoramus, who have enthralled her, but from whom she is eventually released. The stage upon which the performance will be given has been designed, as well as the proscenium, by Mr. H. Wilson, the architect; the costumes have been designed and in many cases fashioned by members of the guild, who are also responsible for the properties and accessories. Tickets are not allowable to be sold at the door, but can be obtained from hon. sec., Mr. H. J. L. J. Massé, at the hall of the Guild, Clifford's Inn, Fleet-street, or at 37, Mount Park-crescent, Ealing. They can also be bought at the Guildhall.

An exhibition of pottery and porcelain, illustrating popular English history, has been lent to the Bethnal Green Museum by Mr. Henry Willett, of Brighton, and will be found to well repay a visit. Over seventeen hundred examples of the ceramic art, chiefly in earthenware, have been brought together, chiefly of the type cherished in rural cottage homes, and although the work is often crude, the collection thus brought together is, from its variety and the subjects illustrated, of great interest. The arrangement and cataloguing is confessedly arbitrary, being based not on the make, date, or original locality of the pottery shown, but solely with regard to the persons or incidents portrayed. Thus a large section is devoted to Royalty, from a candle sconce bearing the arms and initials of Queen Elizabeth over a Tudor rose, made at Houndslow and lent from Hampton Court Palace, to a Diamond Jubilee bust of the Queen. Other cases illustrate military and naval heroes, and soldiers and sailors. A small section is devoted to statesmen, and another to clergymen, the vicar, in his character of tithe receiver, not being treated with overmuch respect in the works executed a century ago, while music, the drama, sporting, field sports, and agriculture are each well represented, as are domestic incidents and those classified under conviviality and teetotalism. Taken as a whole, the artistic merits of the collection are not great, but the designs and inscriptions on the mugs and jugs in a way reflect the habits, customs, and tastes of the people.

THE new town-hall for Colchester, now in course of erection, is described and illustrated in a paper-covered quarto written by Mr. Wilson Marriage, J.P., chairman of the town-hall committee of that corporation, and Mr. W. Gurney Benham, editor of the *Essex Standard*. Mr. John Belcher's perspective view of the building, now exhibited at the Academy, is reproduced as a frontispiece to the book, which is handsomely got up and printed on good stout paper. The town-hall replaces an utterly unworthy pseudo-Classical

structure built fifty-five years ago at a cost of £6,000, and enlarged in cheap and piecemeal fashion a few years since. Mr. Belcher's plans, selected in competition, are being carried out by Messrs. Kerridge and Shaw, of Cambridge, whose tender was accepted at £33,397. While the structural fabric is being provided at the cost of the ratepayers, the embellishment of the building, including the provision of pictures, statues, and stained-glass, is being left to the munificence of private benefactors, and already some valuable gifts have been promised, the principal one being the tower at the south-east corner of the town-hall, given by Alderman Paxman, ex-mayor, and estimated to cost £2,500.

THE work done by the students of the city of Liverpool School of Architecture and Applied Art during the session of 1898-9 is on exhibition in the Walker Art Gallery during the present week and to-morrow. The Lord Mayor opened the exhibition on Saturday, when a large company was present at the ceremony. From a modest beginning five years ago the school has grown vigorously, under the fostering care of Professor Frederick W. Simpson, its director, and gives promise of taking the foremost position among schools of its kind in the provinces. In 1894-5, the average number of students per term was 50, in 1895-6 it was 135, in 1896-7 it was 149, the following year 158, and for 1898-9 it rose to 175; while the class entries had increased from 70 per term in the first year to 336. The exhibits that have been on view this week in the Art Gallery totalled between 200 and 300, and denoted admirable progress on the part of the students. They embraced designs for architecture, working drawings for furniture, modelling, decorative designs, stained glass, wood-carving, drawing and painting, copper and iron work. A new feature this year in the students' work was the stained glass.

PENICUIK HOUSE, Midlothian, was practically destroyed by fire on Friday, involving an irreparable loss to art in the destruction of Runciman's magnificent mural painting on the ceiling of Ossian's Hall. The central portion of the mansion was built in 1761, to the instructions of Sir James Clerk, in the Italian style. The master builder, as an inscription at the archway under the entrance to Ossian's Hall sets forth, was Master John Baxter, sen., while Master James Blaikie was master carpenter. About half a century since wings were added to the central portion to the designs of Mr. David Bryce, with a façade of 180ft. and a depth of 78ft. The mansion thus covered a superficies of 15,000sq.ft., and contained 64 rooms, arranged in three flats. The building was associated with some of the richest memories of Scottish literature, and at one time was stored with historical paintings, rare books, and many exquisite works of art; but within recent years the mansion has been greatly denuded of its art treasures.

THE results of the experiments that are being made with electric traction on the lines of the Metropolitan and District Railway Companies, under the direction of Sir Benjamin Baker and Sir W. H. Preece, are said to be entirely satisfactory; and electric engines are now being made to take the place of the steam locomotives. As a result of adopting electric traction the present mean rate of travelling on the inner circle of 11.2 miles an hour will be increased to 14 miles, so that the time occupied by the journey round will now be 50 minutes instead of 70, while the air in the tunnels will be perceptibly purer, owing to the absence of smoke and steam.

THE question of the provision of houses for the working classes, at rentals not exceeding 6s. per week, has long been engaging the attention of the Devises Town Council, but definite action has now been decided upon, and at a special meeting held on Saturday it was unanimously resolved to adopt the Housing of the Working Classes Act. The corporation has a piece of land adapted to contain ten cottages and to allow each a small garden. They resolved to instruct the borough surveyor to prepare plans for ten cottages, each to contain three bedrooms, two sitting-rooms, and the necessary offices, and to otherwise comply with the requirements of the Local Government Board order of October, 1898. The main difficulty is the cost of erection, as it is stated that no local builders can be obtained to erect the block of cottages for the amount which the council are prepared to give—viz., £1,750. The council cannot go beyond this figure, as the interest and repayment of loans, with the neces-

sary up-keeping, would otherwise entail a loss upon the rates. The council have, however, resolved to keep the offer of £1,750 open.

QUITE recently the Harrogate Town Council purchased the Beckwith Springs, and have conveyed the water to Harrogate, where it is being used at the New Royal Baths, and a further addition has been made to the numerous springs for which Harrogate has become justly popular. At what is known as the Starbeck Baths (just outside the borough boundary) there is a capital supply of sulphur water. Three years ago, the then proprietor offered the estate to the corporation for £15,000. The Harrogate Corporation refused to purchase, and the price gradually dropped to £13,000. During the past few days a member of the Harrogate Corporation entered into negotiations for the purchase of the estate, and got the price fixed at £9,000; and the Town Council, in committee, have unanimously resolved to purchase the estate for that sum. The estate consists of swimming-baths; but, no doubt, the intention of the Town Council will be to transfer some of the water, if not all of it, to the new baths at Harrogate.

MR. RICHARD PELHAM BOLTON has read before the American Society of Mechanical Engineers some suggestive statistics in relation to the cost of high office-buildings and their equipment. Including what the author regards as a moderate amount of exterior ornament, the cost of a building 16 stories high, with steel frame and, of course, fireproof construction throughout, and inclusive of plumbing-appliances, elevators, boiler-plant, pumps, heating apparatus, electric-light wiring for isolated service, with switch-boards, engines, and generators is, in New York City, from 36 to 40 cents per cubic foot, measuring to the outside of the walls. Higher buildings cost proportionately more. About one-seventh of the entire expense is in the boilers and engines, heating and lighting apparatus, and plumbing. These must be of the very best type, if the building is to be profitable, for the saving of the repairs required for inferior apparatus, and the economy of fuel which can be secured by using triple-expansion pumps and compound engines represent a large proportion of the balance of income left over after deducting taxes and mortgage interest and necessary expenses.

A NEW coating, which is said to successfully protect posts and other timber surrounded by earth from rotting, is given by a German exchange. Take resin, 50 parts; finely-crushed chalk, 40 parts; fine white sharp sand, 500 parts; linseed-oil, 4 parts; native red cupric oxide, 1 part; and sulphuric acid, 1 part. First heat the resin, the chalk, the sand, and the linseed-oil in an iron kettle, then add the oxide and the sulphuric acid with caution, mix everything carefully, and paint the wood with the hot mass, using a strong brush. If the mixture is not liquid enough, it is diluted with a little linseed-oil. When the coating is dry, it forms an extremely hard varnish, which allows no moisture to enter.

THE council of the Society of Arts have awarded the society's silver medal to the following readers of papers during the session 1898-99:—Professor George Forbes, F.R.S., for his paper on "Long-Distance Transmission of Electric Power"; C. H. Bothamley, F.C.S., "Photographic Developers and Development"; Dixon H. Davies, "The Cost of Municipal Enterprise"; James Swinburne, "Nernst's Electric Lamp"; J. H. Collins, "Cornish Mines and Miners"; Philip Dawson, "Electric Traction"; Walter Hunter, M.Inst.C.E., "London's Water Supply"; Sir William Henry Preece, K.C.B., F.R.S., "Etheric Telegraphy"; Colonel Richard Carnac Temple, C.I.E., "The Penal System at the Andamans"; Sir John Scott, K.C.M.G., D.C.L., "Judicial Reforms in Egypt"; Archibald Little, F.R.G.S., "The Yangtze Basin and the British Sphere"; Stephen Webb, "Intarsia, or Inlaying"; J. Starkie Gardner, F.G.S., "The Revival of Tradesmen's Signs."

As the result of recent excavations among the lava beds of New Mexico, tracks of ditches and reservoirs, forming part of an elaborate irrigation system of very great antiquity, have been found, the work being declared by the superintending engineers to be superior to the most modern of its kind. The ditches, which are lined with cement, follow the basal winding of the mountains round which they pass. They are carried across chasms and depressions by means of viaducts in such a skilful manner, that they must have

drained off from the mountains all the surface-water, which was carried into the basins constructed at intervals, and distributed thence in every direction to arid valleys. Not only are the basins on such a scale as to warrant the belief that they would furnish water throughout the longest period of drought; but they were so constructed as to provide for the collection of silt and its utilisation as a fertiliser.

The article on "Natural Ventilation," which appeared in our issue of May 26, has been reprinted as a pamphlet, and is being issued by Messrs. Robert Boyle and Son, Ltd., of 64, Holborn Viaduct, E.C. Some very sensible comments by our contemporary, *The Builder*, on the merits and demerits of different systems of ventilation, are appended, and all interested in the subject—who is not?—will do well to obtain a copy.

#### MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Presentation of Royal Gold Medal. 8 p.m.

TUESDAY.—Royal Institute of British Architects. Annual Dinner at the Whitehall Rooms, Hotel Metropole.

FRIDAY.—Meeting of Architects at the Cutlers' Hall, Sheffield, Walter Enden, J.P., P.S.A., in the chair. Paper on "The Statutory Registration of the Profession," by Ellis Marsland. 6.30 p.m.

SATURDAY.—Northern Architectural Association. Annual Excursion to Belsay.

The Architectural Association. Visit to Shooter's Hill House, Pangbourne (Leonard Stokes, Architect), and to a large House in course of erection (J. Belcher, Architect). Paddington, 1.33 train.

#### CHIPS.

A pension for life of £35 per annum has been awarded from the Civil List Fund to the widow of the late Mr. Gleeson White, in consideration of his services in advancing the cause of applied and industrial art.

Charles Bartlett Westcott, described as a builder's foreman, of New Cross, was, at the Southwark Police-court on Saturday, sentenced by Mr. Slade to a month's imprisonment for committing an assault upon Mr. George Crawford, a gentleman of independent means, residing at Old Charlton.

Tenders are being invited for the construction of the Truro and Newquay railway. The portion to be made will be about twelve miles in length, extending from the main line between Chacewater and Scorrier to a junction with the old minerals railway, near Treamble, Newquay.

Mrs. Creighton laid on Friday the corner-stone of the new church of St. Andrew, Bromley, E. The church will provide accommodation for 600 worshippers, and the cost of the building is £8,000.

Mr. George Spalding Fleetwood, A.S.I., of New Court, Carey-street, Lincoln's Inn, W.C., has been appointed surveyor to the corporation of the Orphan Working School, in the place of Mr. George Fleetwood, deceased.

The Queen is to be asked to lay next year the foundation stone of the new infirmary for Newcastle-on-Tyne. The last day for sending in competitive plans is July 26, and the designs are to be exhibited in the city soon after they are received. Owing to the overcrowding of the present institution, the building of the new infirmary will be pushed on as energetically as possible.

On Saturday, Mr. J. J. Cannah, of the firm of Messrs. Cannah and Roberts, sold, at the Blossoms Hotel, Chester, by order of the High Court of Justice, the Afonwen Cement Works, Caerwys, together with yards, clay beds, limestone quarry, marl beds, cottage, and agricultural land, containing in the whole 19a. 3r. 33p., and the vendors' interest in some leasehold land adjoining. The property was acquired by Mr. Capel Cure for £3,000. Messrs. West, King, Adams, and Co., 66, Cannon-street, London, were solicitors for the vendors.

After a prolonged debate, the Brighton Town Council have unanimously adopted a report from the tramways committee recommending the promotion of a Bill in Parliament for laying down electric tramways on the overhead trolley system in various parts of the town.

The rebuilding of the Norfolk and Norwich Library, which was destroyed by fire on the August Bank Holiday last year, will be completed by the anniversary of that date. The contractor is Mr. Yelf, of Norwich.

The urban district council of Paignton have under consideration a scheme for providing a supply of water from Buckland Beacon, on Dartmoor, prepared by their late surveyor, Mr. Vanstone. The estimated cost is £40,000.

## Trade News.

### WAGES MOVEMENTS.

TUNBRIDGE WELLS.—The labourers have now returned to work, their demand of a rise from 5½d. to 6d. having been conceded by the master builders of the town.

DUNDEE.—The master builders decided on Monday to increase the wages of masons' labourers one farthing an hour, making them 5½d. an hour.

DUMFRIES.—The masons' strike, which had entered on its fourteenth week, has been settled by an agreement of the masters to give an advance of a halfpenny per hour, instead of the penny demanded. The standard wage will now be 8½d., and employers are to be at liberty to pay a lower rate, not less than 7d., to men who are not fully competent tradesmen.

A Local Government Board inquiry was held on Friday at the Litherland urban district council offices by Colonel C. H. Luard, C.E., into an application for sanction to borrow £2,750 for works of private street improvements.

On Wednesday week a new organ, erected in St. Luke's Church, Maidstone, was dedicated as a memorial. The organ-case is of oak wood. It has in front three projecting semi-circular towers, under the largest and central one of which is a carving of St. Luke's bull, and under the two outer supporting towers are allegorical carved representations of the Tree of Life and the Vine respectively. The carving has been done by Mr. Turner, under the superintendence of the organ builders, Messrs. A. Hunter and Son, London, Mr. W. H. Seth-Smith, F.R.I.B.A., of Lincoln's Inn-fields, having prepared the designs. There are in the instrument's composition about 1,100 pipes, dummies of white spotted metal forming the face. The cost has been £750.

New offices for Messrs. Cory and Sons have just been built at the corner of Mount Stuart-square, Cardiff, at a cost of £6,000. The buildings are Renaissance in style, and cover an area of 70ft. by 40ft., and consist of a basement, ground and second floors, and attics. Messrs. E. Turner and Sons, of Cardiff, are the contractors.

In the Chancery Division, on Friday, before Mr. Justice Stirling, an application was made on behalf of the Plumbers' Company, defendants in an action brought by Sir Philip Magnus for depriving him of his privileges as a member of the company, that the Messrs. Collingridge, proprietors and publishers of the *City Press*, might be committed for contempt of Court for certain comments on the conduct of the Company towards Sir P. Magnus. It was agreed that a correction of the statements complained of should appear in the *City Press*, and on that understanding his Lordship made no order.

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2321.

FRIDAY, JUNE 30, 1899.

## A COMPARISON.

ENGLISH workmanship and art are often challenged. We are constantly being reminded by writers in our own and American papers and reviews that the efficiency of our mechanics and our art-craftsmen is below that of the French, German, and American. The impeachment to a certain extent is true. It cannot be denied that in some European countries the environment of the art-craftsman is more favourable than that in England. A recent writer in the *Engineering Magazine*, in comparing the machine-shop management in Europe and America, declares generally for the greater efficiency of the mechanic in America. Basing his arguments on the effect of environment on the workman—on which few will disagree—he attempts to show that the environment is most favourable in the latter country. He asserts that the youth in the New World have “better opportunities of acquiring a higher education under more favourable conditions than exist in European countries.” This is rather a bold assertion to make, and before accepting it we ought to be informed what are the conditions most favourable to education in a general sense. Have the American craftsmen the same access to works of art that the Frenchman or Englishman has, for instance? The schools of every grade may be free, and the child of the workman can, without a penny of cost, fit himself for college; but we are not aware that these advantages necessarily make him more skilful as a workman. They have given him a better all-round education; but this is often in an inverse ratio to the development of the faculty of invention or manipulative skilfulness. Our appeal is to the guilds of craftsmen which have all over Europe left evidence of their skill in trades. The guildsman's environment was not much like that in the States. His education was free, but of a very different kind; he was apprenticed to a particular trade, which he learned thoroughly and practically; but his associates were not of every social rank, as in America. Again, a wide range of subjects is not the best for a workman who has to learn a special trade, nor can it be argued that the non-existence of class distinction has much to do with the progress of any art. Again, the same writer observes that the number of skilled workmen with progressive ideas is larger in America than in Europe. It may be so, and this is no doubt largely owing to the free education and the less restricted social intercourse with others of a higher grade; but how this affects the worker's technical skill we fail to see; nor does the writer enlighten us. The European mechanic's position in the workshop, no doubt, “gives him a rank which he is careful to protect, and a recognition which he exacts from all below him,” as he in turn submits to those above. This is quite true, and we do not see how these distinctions can be obliterated in trades like building without injury and overlapping of the trades. What we object to is that the workman should be tied to conventional habits and methods of doing things in his own trade. It is the commercial tyranny that oppresses the English workman which makes him work in a groove, instead of being a free agent capable of doing better work.

The American apprentice has, we are told, “an all-round training, and is allowed to work in every department of the machine shop,” and this training is said to produce

men who can adapt themselves to various classes of work. There is an advantage in a general acquaintance with other trades than the special one the apprentice has to make his own, and it is one of the things that technical education has in view. To the maker of machine-tools it is an advantage to be able to judge of the earlier operations a certain tool has undergone; so the bricklayer must know of the succeeding wants of the carpenter and stonemason to perform his work; and the carpenter or joiner should understand what he has to provide for the slater, the plasterer, or plumber; and so of other trades. In this manner, no doubt, the American workman has the advantage at present. We need not enter into other questions, as to whether it is true that “trade-unionism, as it exists amongst us, is but the concomitant of class distinction.” The German technical system has no doubt tended to make the student more theoretical than practical, and the technically-educated man ignores working details. He can calculate strains and stresses, and make the most minute drawings; but there his work ends. Then there is the question of supervision. That work should be supervised by those who have a knowledge of the end desired is a useful proposition that has not yet been learned. In America “the control and inspection of workmanship by the designer is considered of as much importance as the design.” We are not sure whether this wholesome doctrine is applied to building as well as machine design.

If we look to results, we certainly cannot find all that is affirmed about American work. It is admitted that on this side of the Atlantic machinery is only employed as an aid to production, the skilled hand being relied on to complete; while in America the highest skill is devoted to the production of machinery, not on the article itself. Comparing manufacturing plants and machine-tools, the author of the article we have referred to affirms that the average American manufacturing plant and tools are far in advance of the average European, not only in make, but also as regards design. Cast iron here is not so well moulded, and rarely pickled to remove sand; both it and steel are not so accurately made to size. The European tool is said to “look clumsy and heavy,” the American “light and flimsy”—we certainly think the latter is the case. Such an opinion on machine-tool design need not apply to other fields of design, though we suspect a similar view prevails. Clumsiness and heaviness, waste of material, and want of finish are the faults our Transatlantic cousins attribute to our productions; but is it true the American designer pays more attention to “artistic effect and graceful lines” than the European? Opinions on this question will certainly differ. In objects of utility made in metal and cast-iron work, the American productions may be better finished and more accurate in workmanship, but they are not always conspicuous for elegance or graceful outline. There is an attempt to over-ornament, to over-“bossiness,” if we may use a term that describes much of their castings and woodwork, though these are faults they are happily recovering from. If we are not always so accurate or finished in workmanship, we do not err in that exuberance of detail which is so characteristic of much that is American in design.

## ESTIMATES.—XII.

### SLATER—CARPENTER.

SLATING is often sub-let, and this is probably the cheaper course. Waste at the rate of 5 per cent. is allowed at the quarry, when the slates are bought by the truck-load, and this allowance covers breaking. In calculating the number of slates to the square, a table should be referred to.

The calculation is necessary to be made in some cases, and the following is a rule that may be followed. Suppose we require the number of Countess slates required to cover a square, allowing a 3in. lap. A Countess slate is 20in. by 10in. The gauge is found by taking half the length of slate = 10in., less half the lap, or  $10 - 1\frac{1}{2} = 8\frac{1}{2}$ in. Then  $8\frac{1}{2}$ in. gauge  $\times$  10in. wide = 85in. area, and  $100\text{ft.} \times 144\text{in.} \div 85\text{in.} = 170$  nearly to each square. There are two nails to each slate = 340.

To find the number of squares, 1,200 (a thousand) of Countess slates will cover:— $1,200 \times 85 \div 14,400\text{in.} =$  about 7 squares. Duchesses 24in. by 12in., 3in. lap, will cover  $10\frac{1}{2}$  squares; ladies 16in. by 8in. and a 3in. lap will cover five squares. Westmoreland slates are sold by the ton, and the sizes vary.

13 squares Port Madoc Countess slating laid to 2 $\frac{1}{2}$ in. lap; two 1 $\frac{1}{2}$ in. copper nails to each slate.

Cost of slates delivered in London at, say, £10 per 1,200. If it takes 165 slates to cover a square, then—

165 slates $\div$ 8 = 173, allowing 5 p.c.	£	s.	d.
waste, at £10 per thousand	1	8	4
347 copper nails, 2lb., at 9d.	0	1	7
Slater and laying, say two hours	0	2	0
	1	11	11

A slate merchant will do the same for probably 5s. less per square.

32ft. run. Cutting, &c. to hips and valleys.

At the above price this would be about 4d. per foot run.

45ft. run. Cutting and double course to eaves.

This may be priced at 3 $\frac{1}{2}$ d. per foot run.

To find out exactly, the length of cutting to edge of slate on each lineal foot of raking line should be calculated. Having found this length, multiply it by half width of Countess slate, 5in. The surface cut thus obtained is to be priced at the rate per thousand. It will be found to be about three-quarters of the surface of a slate, say, 1 $\frac{1}{2}$ d., add to which time of slater, say, 1d.

### CARPENTER'S WORK.

Next to the measurement and valuation of the Mason's work, that of the Carpenter and Joiner is the most intricate and perplexing, and the young estimator should make himself familiar with the modes of measuring and taking-out quantities by studying such works as Leaning's “Quantity Surveying.” There are generally two modes of measuring carpenter's work “at per square of 100ft. superficial”—a plan generally followed in approximate estimates—and “at per foot cube,” as in the case of wrought timbers or fir framed in floors and roofs. The latter mode, or “cube fir and labour,” is generally followed, and is the more correct way of estimating materials and labour when the scantlings are large.

The items will appear as so many feet cube. “Fir in plates, lintels, &c.” or as “cube fir in ground-floor joists,” or as “cube fir framed in floors,” “fir framed in girders,” or as “fir framed in roofs or in roof trusses in quarter partitions,” &c., in each case labour and nails being included.

A few useful data are necessary to keep in mind, such as that 50 cubic feet of timber equal one load = 600ft. super. of inch boards, that 120 deals equal “one hundred.” All sizes are generally sold by the Petersburg standard on 120 pieces 12ft. long, 1 $\frac{1}{2}$ in. by 11in., and equals 165ft. cube, or 3 $\frac{3}{10}$  loads. The necessity often arises of making up a standard of a particular scantling; thus, a scantling 12in. by 4in., or one-third of a 12in. by 12in. section, would require  $165 \times 3 = 495\text{ft.}$  run, and a scantling 3in. by 11in. would require 720ft. run, &c. But tables are given which show the number of feet-run of various scantlings required to make a Petersburg standard. An easy rule to find the number of feet-run

required to make a standard is to multiply 1.440ft. (the feet-run of a reduced deal 1½in. by 11in.) by 16.5, and divide product by sectional area of scantling required, and the quotient will give number of feet.

It is necessary to remember planks are 11in. wide, deals 9in., and battens 7in., and the cubical contents in planks, deals, and battens of ordinary thicknesses are useful to bear in mind. Thus:—

A plank 10ft. long 11in. by 2½in.	contains 1ft. 0in. 11pts.
A deal 12ft. " 11in. " 3in. "	2ft. 3in. 6pts.
A deal 12ft. " 9in. " 2½in. "	1ft. 10in. 6pts.
A batten 12ft. " 7in. " 2½in. "	2ft. 3in. 6pts.
A batten 12ft. " 7in. " 3in. "	1ft. 5in. 6pts.

and so on.

Other facts are usefully remembered, such as that £1 per Petersburg standard is about 1s. per square for lin., and 1s. per foot cube is £8 5s. per Petersburg standard.

The following item often appears in specifications and bills of quantities:—"The timber to be of the best description from Memel, Riga, or Dantzic, sawn die-square, &c., and sawn into scantlings after the signing of the contract."

The builder or estimator who strictly adheres to the clause is often placed under the disadvantage of having to affix higher prices than other competitors who price for the market scantlings or planks, deals, and battens of often indifferent quality, and of course he saves in sawing, waste, and cartage. As a matter of fact, moreover, log-timber sawn is often inferior, and is less seasoned than scantlings cut from deals. If cut from good deals, they are, as Seddon says, better than those cut from whole timbers; and the export of planks, deals, and battens is generally from the Northern ports, which produce the closest-grained timber.

A great number of small scantlings are now imported, as 3in. by 2in., 2½in., 3½in., 4in., 4½in., 5in., &c.; 2in. by 8in., 9in., 10in., 11in.; 2½in. by 3½in.; 3in. by 9in., 10in., 11in., 12in.; 4in. by 7in., 9in., 10in., 11in., 12in., &c.

At least 30 per cent., according to Laxton, is wasted when fir timber is slabbbed all round; and at a prime cost in docks of 75s. per load, and, allowing cartage, sawing, and stacking the net timber cut out cost 2s. 2d. per foot cube. This is an important consideration. It is necessary to find the proportion of sawing required in any given building, and this will vary according to the size and design. The feet of sawing per load of timber has been estimated by Mr. Leaning, from calculation of three ordinary buildings, as about 363ft. superficial per load for timber sawn "die square."

In estimating the cost of any item of a Carpenter's bill, the price per cube foot of timber and deals must be determined as a basis of cost, and the elements required may be put in this form:—

Prime cost of load of fir, say	£ 3 15 0
Cartage to sawmills from docks	0 3 0
25 per cent. waste on slabbing	0 18 9
Sawing into scantlings, say, 363ft., at 4s. per 100ft., say	0 14 0
	50) 5 10 9
Per foot cube, say	0 2 3

The price of fir timber varies considerably, say, from 70s. to 85s. per load at the docks.

Laxton gives a rule to find the value of a foot cube of timber when the prime cost is known, which is to add to the price at the yard £1 per load for sawing and carting, then multiply the number of pounds by 6½d. The product is the price per foot, including 20 per cent. profit and waste. Putting £7 as the prime cost of timber at the yard, the result gives 4s. 4d. per foot cube.

The pricebook gives per cubic foot for fir materials and labour in lintels, &c., 2s. 4d. calculated per Petersburg Standard £11 in the docks, adding £1 2s. 6d. per load for cartage, &c.; if timber is cut from bulk at

£3 15s. per load in docks, an additional 8d. or 3s. Swedish timber in scantlings cut from deals is priced at 2s. 6d.

If we take one third of the whole timber in a building as of sawn timber, the other two-thirds sawn out of deals, &c., or imported; we should get—

One-third of a load at £3 15s. 1.....	£ s. d.
Two-thirds of a load at £11 a standard, say	1 5 0
Sawing, say	2 4 2
Cartage, say	0 5 0
5 per cent. waste	0 3 0
	0 3 6

Equal to about 1s. 6d. per foot cube..... 4 0 8

This proportion would probably be a fair one. Add to this, labour calculated at 75 hours constant, we get 7½d. = 2s. 1½d., or, with profit 2s. 3½d. per foot.

We now take a few of the ordinary items found in bills of quantities. It is necessary to find the prime cost per foot cube of timber and deals as the basis of each item. We may put the best Dantzic per load at from 75s. to 80s., the "best middling" at, say, 70s. to 75s., and this is quite as good as the builder ever gets. For labour the constants should be used. For "fir-framed" in floor 8½d. to 9d. is considered a fair price per foot cube, though often contracts are taken at less than 7d.

132ft. cube. Fir in plates, lintels, wood bricks.

Say the price of a load of good middling Dantzic is 75s.—

1ft. cube of Dantzic is at above	£ s. d.
Cartage within four miles, say, at 10s. per load	0 1 6
Sawing to sizes	0 0 3
Cross-cutting, &c.	0 0 3½
Waste, say, 10 per cent.	0 0 2
	0 2 4½

Per foot cube..... 0 2 4½  
Say 2s. 8d., including profits. Laxton prices this at 3s. When cut from deals, this item may be priced at 2s. 3d. per foot.

40ft. cube. Fir in ground joists.

If the joists are cut from deals per St. Petersburg standard in docks at £10, allowing 165ft. cube to the standard	£ s. d.
Waste, 5 per cent.	0 1 9
Cartage, as before	0 0 1
Sawing	0 0 3
Labour, including nailing to plates	0 0 3
	0 2 6½

162ft. cube. Fir framed in floors,

These can also be cut from deals or planks, say 2s. 8d. per foot. If the scantling is 9in. by 3in., the price per foot run at £9 per standard in docks, allowing £1 2s. 6d. for cartage, &c., is 2½d. At this scantling, a Petersburg standard contains 74 pieces 12ft. long.

#### PORTLAND CEMENT AND ITS MANUFACTURE.\*

PROBABLY few materials have exercised a larger share in the development of building and engineering construction than Portland cement. Its introduction marked an important crisis in our architecture when many buildings of importance, and whole streets, squares, and crescents were faced with it. The manufacture, testing, and use of Portland cement have enlisted the study and experimental researches of some of our greatest engineers and manufacturers. The material was patented by J. Aspdin, a Leeds bricklayer, in 1824. It was employed in the construction of the Thames Tunnel by Sir I. K. Brunel soon afterwards, and the names of Smeaton, Sir C. W. Pasley, the late Mr. John Grant, of the Metropolitan Board of Works, the late Henry Faija, Henry Reid, and others have been associated with its manufacture and testing. Several works of a more or less exhaustive kind, and numerous textbooks and papers read at

\* Portland Cement: its Manufacture, Testing, and Use. By D. B. BUTLER, Assoc. Inst. C.E., &c. London: E. and F. N. Spon, Limited, 125, Strand.

societies' meetings have appeared on the subject, but some of these are out of date. Mr. D. B. Butler, Assoc. Mem. Inst. C.E., Fellow of the Chemical Society, &c., and successor to the late Henry Faija, M.I.C.E., has brought out a new treatise on the manufacture, testing, and use of Portland cement, which is certainly one of the most complete and practical treatises that have been published. The author's practical experience of the subject, gained from a long acquaintance with the manufacture and testing of Portland cement, enables him to speak authoritatively. Considerable progress has been made in the manufacture of this valuable material; at first confined to England, cement manufacture is now extended to the Continent. Calcination of the raw materials is now carried on to incipient vitrification, which the early experimenter seemed to avoid; the crushing is now done mechanically, and the clinker raised and fed into grinding machinery, instead of being broken by hammer for the millstones; and the "wet process" or "Goreham process" has come into use. In each case there has been considerable saving of labour. Scientific methods of testing and apparatus have entirely superseded the primitive method of joining bricks together and then gripping them by claws with weight attached; more scientific tests being now in use. A good general definition of Portland cement is given by Mr. Butler: "Portland cement may be defined as a compound consisting chiefly of silicates and aluminates of lime, produced by the calcination to incipient vitrification of a mechanical mixture of chalk and clay, or similar materials containing the requisite chemical constituents, the clinker thus produced being subsequently ground to a more or less impalpable powder." Its principal constituents are: lime 60 to 64 per cent., silica 20 to 24 per cent., alumina 6 to 10, iron oxide 3 to 5 per cent. Three distinct operations are necessary to produce good cement. (1) The intimate blending or mixing of the raw materials. (2) The conversion of the mechanically-mixed raw materials into the requisite chemical compounds by calcination. (3) The pulverisation of the calcined product to enable it to combine with the water, and thereby set and harden. These several processes are described by the author in detail. The raw material—the chalk for instance—must be easily reduced and mixed; hard chalk will cost more to reduce and mechanically mix than a soft chalk. Chalks and estuary muds, such as those found in the lower reaches of the Thames and Medway, are the materials chiefly used, and they are easily mixed, the chalk forming about 2 to 1 of the mixture. Several analyses are given of the raw materials used on the Essex shore of the Thames, and of the cement, also samples from the Kent shore. In both cases the cement analyses show about the same percentage of lime (60.90) and silica. Other clays and chalks and resulting cements are analysed, including the stones and shales of Warwickshire, which are less easily reducible, and have to be treated by the "dry" process. This chapter of the book concerns the manufacturer more than is generally supposed, and is worth attentive perusal.

The "wet process" and "semi-wet" process are fully described with the aid of plans and elevations of wash-mills and illustrations of the machinery and pumps. In the wet process, as our readers know, the chalk and clay are mixed in a wash-mill with a large excess of water, the materials being reduced to a fineness sufficient to rise and overflow the outer edge of mill. The thin "slip," as the liquid is called, is then raised by elevators, and is run by gravitation to a series of settling reservoirs 4ft. to 6ft. deep, when the slurry settles, and the supernatant water is drawn off. The solid deposit is conveyed to the drying floors and kilns for

calcination. The details of the wash-mills or annular pit round which a series of harrows or knives suspended by chains from horizontal arms revolve and break up the chalk are shown by plans and sections. The harrows are triangular in plan. In the "dry process" the materials are ground in a dry state between millstones. Many practical hints are given as to the feeding of the raw material, drawing off the supernatant water from the "backs," separation of sand from the "slurry," and its uniform settlement in the backs, &c. In this process the work is done by the wash-mill with the aid of water, and if done properly the material ought to be in a perfect state of amalgamation. In the "semi-dry" process less water is used, and the wash-mill only partially does the work, millstone and other grinding machinery being used. The author prefers the older or "back" system. Full-size photos. are given of samples of "slurry," showing badly-washed and well-washed mixtures. In both processes the materials should be accurately mixed in their right proportions, and the author illustrates the apparatus used for discovering the percentage of carbonate of lime, including Dr. Scheibler's, Dietrich's, and the late Henry Faija's—the latter a very perfect instrument.

The chapter on "Drying-Floors and Kilns" is illustrated by some of the chief types of combined kilns and floors, as that of the patent of I. C. Johnson, of Greenhithe, which utilise the waste heat from the calcination of clinker. The chamber is long and semicircular in section, with a flue and chimney shaft at end, the slurry being dried by the waste heat of the kiln passing over it. The Batchelor patent kiln, with two tiers of drying-floors with flues under the lower floor, the heat drying the slurry both at the top and bottom, and the Hoffmann or ring-kiln are also described. Dry mills and warehouses form another chapter. It is a most important part of the manufacture to reduce the calcined mass to a fine powder, so as to easily combine with water, as the cementitious value of every particle is in direct proportion to the smallness of its diameter. Several edge-runner or roller mills are explained and illustrated. The "dry process" is next described. The testing of Portland forms a most valuable part of Mr. Butler's treatise, into which we cannot fully enter here. Several separate tests are made—viz., 1, for soundness—i.e. freedom from destructive agencies within itself, or "blowing"; 2, fineness of grinding; 3, strength, cohesive and adhesive; 4, setting qualities; 5, weight or specific gravity; 6, chemical composition. The author justly, however, remarks that any one test by itself, such as tensile strength at seven days only, without examining the other qualities of the sample, is fallacious. Specifications often show egregious mistakes on this point. They insist that the sample, when gauged neat, shall develop a certain tensile strain at seven days, and, if it does, there is nothing more to be desired, whereas a sample so selected may show signs of disintegration at the end of a month, and be worthless. On this point the remarks made are very important, and we may in this connection refer to the chapter on "Specifications," in which the author exposes many errors made by writers of specifications who are inclined to appropriate a variety of clauses that are inconsistent with each other. Thus fine grinding and a heavy weight per bushel are demanded in the same specification, the writer being quite oblivious of the fact "that a finely-ground cement is of necessity a light-weighting one, the weight decreasing in direct ratio to the fineness." Again, why should it be required that it shall be pure Portland manufactured on the Thames or Medway? Other parts of England manufacture equally good cement. The author refers to another instance where a specifica-

tion allowed a residue of  $6\frac{1}{2}$  per cent. on a 50 by 50 mesh sieve, but there was to be no residue on a 40 by 40. "The writer did not realise the fact that with a residue of  $6\frac{1}{2}$  per cent. on a 50 sieve the residue on a 40 would certainly be as much as 5 per cent., and therefore, in order to get the sample to pass a 40 sieve, it had to be ground to leave less than 1 per cent. on a 50." In fact, two cements may leave the same residue on a 50 sieve, and yet one only may have the proper proportion of impalpable powder.

A form of specification is given which, it is claimed, is simple, and would insure the delivery of a good sound cement suitable for almost any purpose. The following is the clause relating to fineness of grinding:—

"The whole of the cement shall be pure Portland cement, and shall conform to the following tests:—

"*Fineness of Grinding.*—To be such that when sifted through a standard sieve having 50 holes per lineal inch, there shall not be more than 2 per cent. by weight of residue; when sifted through a sieve having 76 holes per lineal inch, there shall not be more than 7 per cent. of residue; and when sifted through a sieve having 100 holes per inch, there shall not be more than 15 per cent. of residue."

As to Time of Set, it is provided that a pat of neat cement gauged with a minimum of water at 60° F., and placed on a glass slab, shall not commence to set in less than eight minutes, or take longer than five hours to set hard. The initial set of cement is of great value, yet is often not specified. As to soundness or freedom from expansion and contraction, a pat submitted to moist heat and warm water in the Faija apparatus shall show no cracks or signs of expansion after 24 hours; and as to tensile strength, briquettes of neat cement gauged with the minimum of water, and placed in water 24 hours after gauging, shall carry an average tensile strain of not less than 320lb. per square inch after three days, 400lb. after seven days, and 500lb. after 28 days; and briquettes of three parts of standard sand to one of cement, by weight, treated as shown, shall carry an average tensile strain of 120lb. per square inch at seven days, 200lb. at 28 days from time of gauging. The chapters on testing, adulteration, and the use of Portland cement contain much valuable information.

Mr. Butler's treatise is an authority on the subject, and as a practical handbook we cordially recommend it to all manufacturers and the profession generally. The series of photo-micrographs showing the difference between pure and mixed cements is of interest. The appendices contain data on raw materials, the German standard rules, and the French Government specification.

#### THE LATER RENAISSANCE IN ENGLAND.

[WITH ILLUSTRATION.]

THE change in taste (or, rather, shall it be said in fashion?) which now in a way prevails in architectural design, marks the close of the century with a recurrence towards the declining period of the English Renaissance. Messrs. Belcher and Macartney, by their big folio-work at the present time in progress of publication by Mr. B. T. Batsford, to some extent anticipated the movement, while Mr. Belcher has by his own example endeavoured to stimulate the movement. The style, whatever its failings, certainly lends itself naturally more completely to contemporary ideas than any phase of Gothic work possibly could do, and if treated monumentally with ample masonry and good brick, the Later Renaissance in skilful hands may be rendered picturesque enough, and dignified, too, for the matter of that. The spirit of the Gothic revival may, to some extent, impart its freedom of design and honest use of materials even into Georgian types of building. Mere revivals,

however, can only durate as such while some leading spirits starting the movement invest the mode with a successful mannerism of their own, but who, nevertheless, inspired by a restless desire for something different, directly imitators gather round these revivalists in the heyday of their opportunities and success, they hie away after other models, and so inaugurate a further change in the race for popularity. Experience has constituted this a truism, though, in the mean time, it must be admitted that uncommonly good work is done, notwithstanding no brand-new style is evolved and no absolute originality seems possible. Those only, however, who have but a superficial acquaintance with contemporary architectural design will question this, or declare that there is nothing new about modern architecture beyond the materials employed in its construction. Distinguished persons in the profession, it is true—and one Royal Academician in particular, by way of measuring his own immeasurable position—may have presumed upon the credulity of the hearers by exclaiming that there are no architects nowadays. Strange to relate, these same egotists in the profession, almost in the same breath, have been heard to assert with pride that none of their numerous pupils ever really do bad work. Such assurance is curious, of course, and is not coincident with facts. The onslaughts of outside critics, writing in re-echo of this R.A.'s boastful assumption above mentioned, as to there being no architects worthy of election at the Academy, declare that the work now done is but a dismal endeavour to copy examples of defunct architecture.

The question suggested, therefore, by the production of such volumes as those now being issued by Messrs. Belcher and Macartney becomes one of more than casual interest, embodying a doubt, as it does, concerning the real use which will be made of the illustrations thus brought together. Are they to be studied as representing the later developments of a national growth of Renaissance building, or will the photographs be treated as so many specimen sheets, like fashion plates, to crib from? It can scarcely be urged on their behalf that the buildings shown exemplify principles such as the advocates of the Gothic Revival were enabled to show when classifying and analysing Mediæval details and designs. "Design with beauty and build with truth," the well-worn motto of the Architectural Association, hardly accommodates itself to the altered circumstances thus brought about by this more recent change in so-called taste, and in order to cloak the Later Renaissance movement, if it may thus be dignified, much is made of the inadequate character of the dry bones of the Styles, their discrimination and classification. Of course, this is true to some extent, and it is a commonplace that even in a poor style a genius will master sterility and stamp his designs, no matter how meagre the style, with freshness and individuality. Of course he will, and that is where genius always will come in. Some of the examples selected by the collators of the Later Renaissance scarcely, however, accommodate themselves to adaptation, while for exact imitation they probably are not intended. At any rate, the illustrations place on record some of the old plain Classic-like houses of lesser importance which add so much interest and quaintness to the streets and byways of our historic towns, like those given in the present part from Stamford. It must not be supposed that the folio is only occupied with minor examples of the style. Every care appears to have been taken to insure a representative character to their illustrations. Melton Constable, Norfolk, and Belton House, Grantham, The Great House, Barford, and Croxteth Hall, near Liverpool, are among the historic mansions represented, and there are also some excellent details of interior work of the period from Houghton Hall, Norfolk, a very interesting house, Thorpe Hall, near Peterborough, The New River Company's Offices, E.C., and the organ-case from Pembroke College, Cambridge. The Radcliffe Observatory, Oxford, is a strange structure, not so well known as many, and the Orangery at Bowood, Wilts., with the formal gardens in front and the encircling stone-built terraces, makes an attractive picture, though architecturally the composition belongs to the same category as the last-named subject. The Town Hall at Abingdon has never before been better illustrated, and we are glad to possess so capital a view of so clever a building. Somerset House, Kensington Palace

entrance, and Boodle's Club, an ugly and not interesting front, also in St. James'-street, figure well in this part before us, and so does the Banqueting Hall, together with the Alcove in Kensington Gardens. The Moot House, Downton, near Salisbury, with its grey headers enlivening the brickwork, is a four-square, comfortable-looking house, having a central pediment over the porch; and some excellent measured drawings of two other good old houses are furnished from Blandford, in Dorsetshire, delineated by Mr. A. Needham Wilson. The Queen's House, Greenwich, is a more familiar subject; and more so still, of course, is the Horse Guards, Whitehall, one of the most pleasing public buildings in London. No work on the Later Renaissance would be complete without an illustration of Trinity College Library, Cambridge, and we congratulate the authors for including such charming specimens of Old London Doorways as those on Plate X. from Mark-lane and Grosvenor-road. We have chosen the Fountain Court, Hampton Court Palace, for illustration to-day. It is too well known to need any description; but we do not think so capital an illustration of it has been illustrated before. Geometrical drawings have appeared in our pages, but we do not recall a really good detailed view. We give it as a sample of the rest of the illustrations included in the volume under notice. Enough has been said to indicate the able way in which the authors are doing their work, and it is quite clear that no efforts are being spared to render the book a fitting companion to Messrs. Gotch and Talbot Brown's earlier publication. To be able to turn to so representative a series of examples of domestic buildings erected subsequently to the Elizabethan period is certainly a great advantage. We presume that the concluding part will be accompanied by descriptive letterpress, which, if concisely done, will materially add to the permanent value of the publication. What is more important still is the inclusion of plans of the buildings shown. So much necessarily depends upon the plans, and we hope they will be made as complete as possible.

#### THE RENEWAL OF RAILWAY BRIDGES.

IN the year 1885, after an accident that occurred to a bridge in the South of England, constructed with cast-iron girders, which suddenly and unexpectedly failed and allowed an engine to fall through into the road below, the Board of Trade called the attention of the various railway companies in the country to their bridges carrying railway lines, and requested the companies to consider the strength and efficiency of the same under the circumstances of increased weight, speed and number of trains, since many of these bridges were erected, perhaps in the very early days of railway enterprise. During the last few years quiet, but rapid, progress has been made by the companies in the strengthening of their bridges, and in the substitution of wrought iron or steel girders for those of cast iron and of timber. Of course, the traffic department is to the user of the line of more importance than the engineering department, and the renewal or strengthening of nearly all these bridges has been hampered with the condition that the traffic must be not disturbed at all, or to such a small amount (say by special signalling arrangements) that no block to traffic shall take place. It is almost of equal importance that the traffic under the bridge, if the bridge is over an occupation or public road, shall not be disturbed. When it is over a stream or river, it is obvious that nothing can be done more than the driving of a few piles in the river bed, or the erection of trestles. In the case of a canal or navigable river, the railway company is unable to delay the traffic to any serious extent. Thus, when it is decided to strengthen or renew the superstructure of a bridge, the first consideration is how it is to be done with the least disturbance of the use of the bridge.

#### BRANCH LINE: TWO LINES OF RAILS.

Taking the case of a small bridge on one of the branch lines of the railway, with up and down lines of rails, it may be found that the traffic will allow of single-line working, and temporary cross-over roads are put in on each side of the bridge, and with a pilotman, whose duty it is to accompany each engine over the bridge, and special signalling arrangements, the traffic is diverted to one road and one side of the bridge until the other side is renewed and the perma-

nent way replaced. From two to ten days is the greatest time that can be given for each side. The girderwork has to be fitted together and marked for erection in the yard in which it is built; all packings and bolts are put in their place, so that no hitch can take place during the erection on site. In most cases travelling cranes are used for the lifting of the girders on to their beds. These are of from five tons to fifteen tons capacity, and run upon the railway lines, and are moved by ordinary locomotive engines. Some of these travelling cranes are worked by steam, but most of them are the usual "break-down" cranes, worked by hand-power. The girders accompanied by the cranes are carried to the bridge on the line available for working, and as this operation must be done between trains, no time is to be lost. Probably the operation will be deferred to the Sunday, when the traffic is at its minimum amount.

#### MAIN LINES: TWO LINES OF RAILS.

In the case of an ordinary bridge, say, on one of the main lines of the railway, and carrying two lines of rails, up and down, nothing can be done that will disturb the traffic during the week-days. Sunday is the only day available, and then only between the ordinary trains. If each line can be blocked for one Sunday the erection is arranged to be done on one day for each line. Cross-over roads will have been laid down at each side of the bridge, and at midnight on the Saturday are brought into use for twenty-four hours, and the operations are arranged accordingly. A gang of men with Wells's lights at once set to work to remove and stack on the side of the line the rails, chairs, and sleepers; another set will be preparing or bringing to the site the bed-stones, bricks, and mortar necessary for the reception of the girders, whilst another set will be bringing up the girders. In four or five hours—say, at 5 a.m.—the permanent-way and ballast will be removed, and the stripping of the old structure been commenced. Generally there are holding-down bolts or tie-rods between the old girders to be removed whose existence had not before been known. These often occasion a considerable amount of trouble in cutting out. In the meanwhile, and between the trains that are timed to run on the one available line, the cranes will have come up to the bridge and lifted the old girders from the bridge on to empty trucks standing ready on the rails. Once the floor of the bridge is away and any tie-bolts removed, the lifting of the old girders on to the trucks is an operation that will take but a few minutes, and the "engineer's train" at once retires to a siding to clear the line. Two sets of masons and bricklayers now commence to prepare for the new girders, one set on each abutment, and will perform their part of the work in from three to five hours. By this time it is probably noon, and the men rest for meals. The bridge is now ready for the new girders, and the cranes, which in the goods-yard of the nearest station have been shunted to form a train with the new girders, now reappear. The lifting of the girders to their site will probably be done in a couple of hours, the fitting and bolting in two more hours, when the new floor is commenced to be laid. In the case of a timber floor the work is very simple, and consists of simply laying down the timbers; but over a public road or important occupation bridge, a water-tight floor is essential, and this cannot be provided where timber planks alone are used for the floor. If a plate-floor of iron or steel is adopted, the design must be such as will enable any riveting on site to be done well within the time allowed between the actual lifting of the main girders into position and the relaying of the permanent way of the line. Sometimes part of the riveting is left to be done during the week-days, but in this case such rivets must be in a position well clear of the rails, chairs, or sleepers, and the operation of riveting must be carefully watched to prevent accident and possible loss of life when trains pass over the bridge. If concrete is used, say, to provide a surface suitable to drain the water from the centre to each side of the bridge, quick-setting Portland cement is necessary, and once the concrete is fairly set, it must be covered with hot asphalt to provide a waterproof surface. It is doubtful whether it is good work to lay the asphalt so soon after the concrete is laid, and often a week is allowed for it to set before the asphalt is laid; but it is sometimes thought better to lay the asphalt at once and preserve the concrete from weather. Fre-

quently the time available is so short that the asphalt has to be immediately laid when the concrete is sufficiently set, and the ballast and sleepers of the permanent way have to be laid down before the asphalt is thoroughly cool. The best mineral asphalt should always be used, not pitch, and this in two or three layers; between each two layers a thickness of wire lattice or brattice cloth should be laid to provide the necessary tenacity and elasticity. Callender's or other bitumen sheeting is frequently used. The vibration in railway bridges is so great that unless the surface is very well sloped and the asphalt and concrete perfectly made, water will get through, and the state of things as regards drainage practically be worse than if a timber floor were adopted. Ironwork that is not accessible for painting, such as those parts imbedded or covered with concrete, will be accessible to water, and corrosion must inevitably ensue, all the more dangerous as it is hidden from sight. The construction of jack arches between the girders of bridge renewals or main lines of railways is practically out of the question, there not being time sufficient for their construction. Except in the case of short spans, or exceptionally stiff girders, they should never be used for railway underbridges, it being almost an impossibility to make the work watertight when the deflection of the girders is at all considerable. It will be seen how necessary it is to make the portion of the bridge carrying each line of rails independently of other lines, so that each line is on a separate set of girders of its own. This will enable each line of rails to be moved or renewed whilst the other lines are undisturbed. This arrangement will also enable each set of girders to deflect under their own travelling load, and avoid the twisting action found in the ordinary type of railway bridge where two lines of rails are carried by two outside and one inner or centre girder. In some cases an altogether different type of renewal is adopted. The old structure is lifted by hydraulic jacks to the height required, in order that cross girders may be placed underneath the old structure without lessening the headway of the road or canal underneath, even temporarily. These cross-girders are in their turn carried by "main" girders spanning from abutment to abutment and placed outside and independent of the old structure. What occurs is, that practically the new bridge is built outside and underneath, and completed before the old bridge is interfered with. Of course, in the cases of unlimited headway—which are found to be very rare—it is not necessary to lift the old structure before the new cross-girders can be placed in position. The objection to this arrangement is that in a normal case the rails over the bridge will have to be belifted something like 3 ft; and as, under the regulations of the railways, the lifting can only be done a few inches at a time, this raising of the rails is by no means a small matter. When the new structure is finished, the old structure is simply lifted off and the rails lowered—again a few inches at a time—upon the new cross-girders, and the work of renewal is complete. By this mode of treatment the traffic and signalling arrangements are very little interfered with, the only serious delay being when the old girders are lifted away, and this need not occupy more than a few hours on some convenient Sunday. Of course, the rails for a considerable distance each side of the bridge are in charge of special gangs of men, who raise or lower the rails with their chairs and sleepers attached to suit the work that is being done upon the bridge, and as the gradients must be fairly easy, the raising and lowering affects several hundreds of feet of length of railway. It is generally found that the abutments are not long enough for the increased width of the bridge when the new outside girders are added, and it is usual for the two outside or "main" girders to be carried on vertical stanchions, one at each end, which may, or may not, be built into the brickwork or stonework.

#### ERECTION ON TRESTLES.

Several of the railway companies have adopted a system of renewal which, from an engineering point of view, is a greater operation than the simple renewal of piece by piece, but from a traffic point of view is perhaps more approved, and that is the removal of the old structure entirely and at once, and the placing in position of the new structure at once in one piece. Long trestles are erected in the same line as the abutments, and extending a sufficient distance on each

side of the bridge. The trestles on the one side of the bridge are built to receive the old structure, when it is rolled off the bridge in one piece, and on the other side of the bridge to receive the new structure, which is built on a platform supported by the trestles, complete, before it is moved. The trestles must be firmly constructed both to safely carry their respective loads, and to withstand the rolling over of the structure. A crane or some arrangements for raising from lorries, &c., the plates, bars, &c., required for building the new structure will have to be provided, and appliances for removing the old girders after the rolling over will be required on the set of trestles on the other side of the bridge. A floor is laid on the trestles for the new bridge, and the girders, after being fitted together in the contractor's yard and marked, are brought in plates and bars, and put together and riveted on the platform on the trestles. As much of the floor of the bridge as possible, including the concrete, asphalt, and ballast, if any, are laid on the new structure, which is then ready for the rolling over. The next operation is to prepare the old bridge for its removal. Sufficient room is left between the top of the trestles and the underside of the girders for a small trolley, which runs on rails spiked to the top member of the trestle. Each end of the main girder is raised a few inches by an hydraulic jack, and when fairly carried on the trolleys and the crabs with tackle for hauling over are arranged, the preparations are complete. The most convenient time is selected, the crabs and moving tackle are tried, and the men are told off to their posts—some to remove the permanent way, some to work the crabs, and others to see that the trolleys and rails are lubricated and the tackle in proper order. Immediately after the passing of the last train the keys are knocked out, the rails are lifted off, and the sleepers with the chairs attached are taken up, and as much of the ballast as necessary is removed. Two "crabs," each manned with four or six men, now commence to roll off the old bridge. Each trolley and bearing of the girders is carefully and specially watched, and unless there is some hitch the operation is performed in from ten to sixty minutes. Without any loss of time, the "crabs" that are to move the new bridge are manned, and the work of pulling on the new bridge is commenced. Greater care has to be taken now that the operation shall not injure the riveting or attachments, and probably the trolleys will not be used, small iron rollers on plates being found to be better. The operation of pulling the new bridge on will occupy more time than the preceding one of pulling off, perhaps one hour to three hours being thus taken. When in the correct position the ends of the girders are taken by hydraulic jacks, raised from the rollers and lowered on to their bearings, and the renewal is complete. The ends of the bridge over the abutments are now made good, say with brickwork, concrete, and asphalt, and the permanent way relaid. The old bridge, together with the trestles, can be taken to pieces and removed piecemeal during week-days.

#### STRENGTHENING EXISTING GIRDERS.

Existing girders may be strengthened by various means. In some cases cast-iron girders are strengthened by being cut. This is the case when a long cast-iron girder rests on a central pier or prop, and is, therefore, a continuous girder. Under certain conditions of loading, and especially if the top flange is small compared with the bottom flange, a tensional stress will occur in the top flange over the point of central support, and this may be the weakest part of the structure. In this case the girder is cut by means of holes drilled closely together through the girder over the point of support. In other cases girders are propped by columns, either in the centre of the span or, if the bridge be a large one with roadway and footpaths each side, perhaps two columns, one on the edge of each footpath, may be adopted. A row of piles driven in the bed of the stream may be used in river bridges, or a framing on screw piles may be used. Cylinders filled with brickwork or concrete may be sunk in long river spans, and a girder is put across between or upon the cylinders. Upon this the old girders are made to rest, and are wedged up to an extent to be very carefully calculated by the engineer of the railway. In some cases, where it is not expedient to insert piles, columns, cylinders, or piers in the centre of the span or opening, light wrought-iron or steel arch ribs may be thrown across between the

existing abutments, and the old girders wedged up from them. In some cases old girders, whether cast or wrought iron, are strengthened by having new girders placed underneath transversely to the old girders, carried by additional main girders placed outside the old structure parallel to the old girders, and resting on the old abutments. In some cases it is necessary to adopt stanchions or columns to carry the new girders, if the old abutment is not of sufficient length to receive them. In all these cases it is very necessary to insure that the strengthening is of advantage, that deflections before and after strengthening be carefully ascertained, and the old girders wedged up to the extent necessary to reduce the original deflection to an amount which is the result of a careful calculation. In some cases wrought-iron girders are strengthened by removing them from the bridge, which is supported in the mean time by temporary girders or trestles, and strengthening the wrought-iron girders by additional plates or bars. If the girders are too large to be thus moved from their place, they can have the additional plates or bars riveted to them whilst in position; but it must not be forgotten that if this is done whilst traffic is running over the bridge the additional plates will merely become extra dead load, unless trestles be placed under the girders to carry the moving load whilst the new portions are being riveted on. In this case, however, if the trestle is only placed under the girder to carry the moving load, the stress already produced by the dead load remains constant, and the new plates will take the moving load, along with the old plates, but no portion of the dead load. It is preferable, therefore, to remove the dead load or weight of the bridge itself as well as the load of the traffic, and to do this the girder must be wedged up from the top of the trestle, and a certain amount of the deflection from the dead load removed. To ascertain this is a simple proportion sum, based upon the deflection caused by the passing of known travelling loads, the deflection from dead load being calculated therefrom. If this is carefully done, the new plates that are added will carry their proper portion of the total load that comes upon the girder.

#### MATERIALS THAT ARE USED.

It may be taken for granted that the old form of cast-iron girder is doomed to extinction for bridges that carry railways. True, the Board of Trade do not object to the use of cast iron in the form of arched ribs, in which the whole of the metal is in compression; but as these are very unwieldy to handle, and not always reliable in casting, it is very unlikely that they will be much used in the future. Steel is now so very cheaply made and improved in strength and tenacity, and is distinctly the metal for bridge girders of the immediate future. It was used in the Forth Bridge and the large bridges of the Manchester Ship Canal works. Some metal that will not so readily oxidise is still awaiting discovery, or if it can be more cheaply obtained, perhaps nothing could be better than aluminium.

#### "BEAUTY'S AWAKENING."

THE masque presented by the members of the Art Workers' Guild at the Guildhall during the past week has certainly completely realised its authors' aim of "something good" in form and colour and fancy. The "plot"—if we may use the word, remembering, as the authors explain, that a masque is not a play—is a very simple one. The life of modern cities is satirised, and the means of regenerating it indicated by a significant adaptation of the old legend of the Sleeping Beauty. Beauty sleeps, under the spell of the witch Malebodea, with her train of Demons; round Beauty sleep the Seven Lamps of whom Ruskin wrote. At last, at the destined moment, and after dances of the Forest Leaves and a march past the famous cities of the world, Truehearte the destined knight approaches, and Beauty wakes. She wakes just in time to save London from the persecutions of the eight Demons, and the redeemed and regenerated Queen of cities takes her proper place in the procession round the hall, which closes the masque.

Those who saw the masque on Tuesday were disappointed by the omission of some of the most vigorous lines in the book, in which the Demons are denounced with an unction which possibly it was thought would be thrown away on the people

of the City. The procession of famous cities is the great feature of the spectacle. Thebes, Athens, Rome, Byzantium, Florence, Venice, Nuremberg, Paris, and Oxford are each represented by a lady, supported by appropriate attendants; Athens by Pheidias, Paris by St. Louis, and Oxford by King Alfred and William of Wykeham, with suites of youths and maidens, soldiers and students. The successive scenes were introduced by a prolocutor (Mr. Selwyn Image), in the traditional garb of the poet, with a golden wreath. The literary authors of the different parts of the masque are Messrs. C. R. Ashbee, Walter Crane, Selwyn Image, C. Harrison Townsend, C. Whall, and H. Wilson; in the artistic designs most of these have taken a part, and they have been assisted by other well-known artists, such as Mr. Henry Holiday, Mr. W. R. Lethaby, Mr. Alexander Fisher, and Mr. Hope-Pinker.

The book of the play, which is a very beautiful one, is produced by Mr. Ashbee, and admirably illustrated by Mr. Wirgman, who contributes an excellent drawing of Mr. Walter Crane as Albert Dürer, Mr. Joseph Pennell, Mr. Beresford Pite, Mr. H. Wilson, H. Stannus, Henry Holiday, and others. An *édition de luxe* is in preparation, limited to 250 copies at £3 3s., and 25 "special" copies at £5 5s., and which may be subscribed for by application to Mr. Massé, the secretary of the Art Workers' Guild, 37, Mount Park-crescent, Ealing.

#### NOTES FROM EDINBURGH.

THE state of business in the building trades for the past half-year shows undiminished volume and unintermitted progress, save in so far as the existence of a protracted joiners' and short plumbers' strike have interfered with it. The latter has been settled in favour of the workmen, who have thus obtained a halfpenny more per hour. The settlement of the other appears to be a very much more difficult matter to decide; the demand for an extra halfpenny per hour being considered, on both sides, of minor importance compared with coming to an agreement as to the conditions under which the work must be carried on. This strike has lasted three months, and doubtless occasioned much inconvenience to parties who had expected to have tenements finished for occupation at the term, as well as others. Still, the progress made with the larger undertakings appears to have been continuous and unaffected by the joiners' holiday. The southern portion of the Waverley Railway Station Hotel has now two floors completed above ground level, and the excavations or foundation work of the northern or Princes street portion has made good progress. The large block of buildings forming the ticket, refreshment rooms, and offices is all but completed in the mason-work—the glass of the roof over the platform is completed on the east side, and only a small portion of that of the west side remains to be done. The footway bridge on the east side is completed, all but the connections at either extremity; and the confusion of constant alterations in the platforms, &c., of former years has well nigh disappeared.

The reconstruction work of North Bridge-street has made great advances. On the west side especially, where the work of excavation was not so great, the tenement at corner of the High-street has both elevations all but completed, and as a sample of the whole gives promise of a stately and picturesque addition to the street architecture, not unpleasantly in contrast with old Scotch building of the High-street, and without tiresome repetition of common and outworn Classical details. The style is Renaissance, without florid decorative detail. The most characteristic feature appears to be a recess, carried through two floors on each side of a central projection. These recesses have deep splayed sides, with moulded arches, on moulded impost, and in these an oriel window for the lower floor has been erected with good projections, and which does not, as many of these do, give an impression of an unnecessary feature crushed into a too narrow space. Another characteristic is the projection of the attic, or fourth floor, on a series of deep, many-canted corbels. The whole is carried out in a cream-coloured fine freestone. The work of reconstruction on the Market-street frontage is built up to the first floor. On the west side there has been little done but excavation and making the concrete foundations of party-walls. Preparation is made, however, for demolishing the south part of the old street. This work has been delayed by

the Bank of Scotland contesting the right to close up public access to the space which for two hundred years has been known as Milnes-court, and which, under the reconstruction, is greatly reduced.

Another large addition to the public edifices which mark the course of reconstruction in a better style, is the block of building erecting at the corners of Hill-street. South Bridge-street, though fairly wide, is very commonplace in its style, and is indebted entirely to the reconstruction of its shops for ornamental details. It terminates well with Chambers-street and the University with its dome. The Royal College of Surgeons, with its pure Classic style front, is the only building of any interest in the thoroughfare continued south, as Nicolson-street. But this great artery of traffic southwards, which has always been the principal access to the city from the south, and which is built mostly with substantial, but far from ornamental, rubble-work, is not likely to remain so. The building now completed in elevation at Hill-street is in five floors, with wide-arched windows on the ground floor, and nicely-moulded lintelled windows on the two above; whilst the fourth has massive columnar decorative arcading, and a massive cornice with attic dormers to the roof. The corner is treated as an octagon, with entrance-door to the back, with pediment on richly-carved trusses.

Another large addition completed in its masonry is the new wing of the Royal Infirmary. Neither in its style, which is Nondescript Classic and Elizabethan, nor its material, which is red freestone, is it in harmony with the old work in Scotch Baronial.

The important alterations making in St. Andrew-square and the north-east portion of George-street, adjoining the square, are completed in their masonry, and the sculptors are busy with the elaborate frieze which decorates the Standard Insurance Co.'s portion. This comprises the well-known Classical garland of fruit and flowers, upheld by groups of youthful figures. The pediment over the central projecting part of the design is rather steep and heavy-looking, and has nothing to relieve the great expanse of ashlar surface. The old office had a good design representing the parable of the Ten Virgins. The Royal Insurance Building, which forms the western end of this ornamental part of George-street, has a very extensive frontage to St. Andrew's Church. In the grouping and variety of its windows, in all the moulded stringcourses and cornice, and especially in the elegant design, which has provided for the inevitable chimney flues of the gable, this façade will take its place as one of the most ornamental in the city. The front, which, unfortunately, is very narrow, appears, on a general view, as a very suitable termination to the buildings which adjoin it, and in this view it is all that could be desired, with a lofty gable, with graceful figure of one or other of the cardinal virtues as a finial, and two supporters of proportionable size at the foot. An oriel of slight projection is provided on the upper floors, and the ground floor elevation is decorated with monolithic pillar and pilasters of dark grey granites. In all their buildings the floors are fire-proof, constructed with concrete and hollow fire-clay tubes.

The Nelson Branch Free Library in Hamilton-place, near Stockbridge, is also nearly completed in the mason-work. It occupies a sharp angular site, terminating at the angle with what will be an octagonal tenement. It is in one story, with two gables to the street, connected with a parapet which is carried round. The gables have markedly emphasised corbel step skewes, and the windows, which are lofty and mullioned, are very nicely moulded. The building forms an elegant companion to the fine Gothic edifice of the district board school, one of the early examples built after the passing of the Education Acts, from designs by Dr. Anderson.

Two interesting buildings, being villas built at the west end of Bentsfield Links many years ago, with pronounced Gothic detail, to show what could be done in that style in the way of Domestic Architecture, are to make way for a lofty tenement, continuing the south side of the street, which has taken the place of the Viewforth suburban villas of early date. Access to the suburbs is now so easy that first-class houses, in the form of detached villas, are in demand, and apparently more so than those constructed in the style of streets. No additions, at least, are being made where sites for such buildings are to be had, as along the Queensferry-road, which is within easy walking distance of the city proper.

The House of Lords has now given its quietus to the controversy concerning the site of the Usher Hall, so that, if it is ever built, it may be in the centre of Athol-crescent. The selection of this site has been made in defiance of the principle laid down at first by the council, and in virtue of which the Castle-terrace site was abandoned, though every way better and more central. It was manifest, however, that no site that could be selected would be unobjectionable, on the ground of destroying valuable property, except that suggested and approved by Mr. Waterhouse—the west corner of the Meadows. As it is, with the heavy burden of expense to be met in purchase of valuable property, Mr. Usher's gift is rather more of a white elephant than could be wished, if a hall merely for musical encouragement and entertainment and occasional larger meetings of a public character is to cost £100,000, and its site another £60,000. Most people think that such a hall, site and all, should not cost the city more than £100,000, which is more than enough to spend on a building of that description. School and city rates, even under members pledged to economy, have been rising by large instalments.

A permanent chancel is about to be added to the new church at Shaldon, South Devon, from plans by Mr. E. Sedding, of Plymouth.

#### FURNITURE FROM THE DUDLEY HARDY SALE.

THE pieces of furniture given this week come from the much-talked-of collection of that well-known poster-artist and connoisseur, Mr. Dudley Hardy, and were recently disposed of by Messrs. E. Newton and Co., of Chancery-lane. The Table depicted is of massive dark oak and of Charles I. period. It has heavily carved legs, with square blocks as bases, firmly held by stretchers. The 6ft. Jacobean Cabinet is also of oak. The upper portion sets back and contains two cupboards, the doors of which are heavily moulded, the inner panel having small pilasters with circular heads. The bottom portion also has two large cupboards, the upper panels having similar pilasters with carved spandrels. The key and hinge are quaint; both the Table and Cabinet are typical specimens of Old English furniture. They were sold for £11 and £32 respectively.

On Saturday Colonel W. R. Slacke, R.E., held an inquiry at Bangor, touching an application made by the town council to the Local Government Board for power to borrow £4,500 for the erection of a refuse destroyer in connection with the electric light station, from plans by Mr. F. H. Medhurst, B.Sc., and £143 for providing additional public baths at Siliwen. There was no opposition to either proposal.

## PRESENTATION OF THE ROYAL GOLD MEDAL TO MR. BODLEY.

THERE was a large attendance of members and visitors, including many ladies, at the closing meeting for the present session of the Royal Institute of British Architects, held on Monday evening at 9, Conduit-street, W., to witness the presentation of the Royal Gold Medal for 1899 to Mr. George Frederick Bodley, A.R.A., the latest accession to the rank of Fellow in the Institute. On a screen were displayed a series of about a score large-scale photographs of the principal works executed by Mr. Bodley, independently of Mr. Thomas Garner. These included Queens' College Chapel, and additions to King's College, Cambridge; the churches of St. Saviour, Cardiff; St. Mary, Clumber; Hickleton; St. John the Divine, Kennington; St. Matthew, Westminster; St. Paul, Knightsbridge; Holy Innocents, South Norwood; St. Mary, Primrose-hill; St. Barnabas, Pimlico; Cowley (Mission); and the Eton Mission Hall, Hackney Wick. Four past Royal Gold Medallists were among those present, Sir Arthur W. Blomfield, A.R.A. (1891), Messrs. James Brooks (1895), Ernest George (1896), and Alfred Waterhouse, R.A. (1878). Unfortunately, the occasion was deprived of much of its usual interest by the absence of the President, Mr. George Aitchison, R.A., who was suffering from an attack of gout. In his stead, Mr. W. MILNER FAWCETT, M.A., F.S.A., of Cambridge, took the chair, and in making

## THE PRESENTATION,

expressed regret at the cause which had led to the pleasant duty being intrusted at short notice to a country cousin, adding: There is one reason beyond that of being your senior vice-president which makes me not entirely out of place. I have known Mr. Bodley far longer than I have known anyone in this room. It was, I think, in 1852, when I was little more than a boy, that he came to Leeds to help a friend of his long since passed away. I well remember how he graphically described the delivering up of the drawings in some verses, which I fear are now absolutely lost to posterity. If long acquaintance, and I hope I may say friendship, is any title to the honour I feel in presenting this medal, I think I have perhaps shown that I possess it. I have also the further title in that I have always been a great admirer of his work, feeling that he is indeed a true artist whose designs and conceptions will receive the approval and admiration of generations yet to come. We have the further pleasure of welcoming Mr. Bodley among us as a Fellow. We all know the broad view taken by this Institute with regard to the profession—that there has never been any wish to coerce architects to join us, although we believe that the action of the Institute has been of great value not only to the architectural profession, but to architecture as an art. Feeling this, we cannot but rejoice in numbering Mr. Bodley in our ranks. Mr. Bodley's work is so well known to you all that it hardly needs comment from me. Soon after leaving Sir Gilbert Scott's office he commenced practice on his own account, and St. Michael's Church, Brighton, was one of his early works. At this time he was feeling the monotony of the work done—he must have felt it as what I have heard described as Gothic “revived but not revived”—and, after some travel abroad, he evidently felt relief in the change to French work, and hoped to get life by working freely with it. This phase did not last long. He soon felt that mere variety was not life. He was a young man striving for the light, but he was also a strong man, and, like a great ship which requires the buffeting of a voyage to let it settle down in its true lines, it was necessary for him to pass through a struggle of this kind before he could grasp his work and give life to our own English Gothic. How far he is personally sensible of this I can hardly say; I am speaking as to how it appears to a brother architect. St. Martin's, Scarborough, was another of his early works where the French idea is less pronounced, and where we can feel the influence of the Priory of Kirkham not far off. All Saints Church, Cambridge, which was built in the early sixties, has no trace of this French fever, which by this time has passed quite away. It is impossible here to enumerate and describe all the buildings he has carried out, but I may mention the church at Clumber for the Duke of Newcastle as a particularly fine work.

The church at Eccleston for the Duke of Westminster is, if possible, more successful. It is hardly finished, as the screens and reredos are not yet fixed; but it has been an opportunity for carrying out a complete work with all its accessories, and the unstinted and munificent wealth of the donor has probably not made the successful result less difficult. In quite a different style is the church for the Cowley Fathers at Oxford. There the work is remarkable for its quietness and simplicity; but what a grand simplicity it is! It is not in church work alone that Mr. Bodley has won his laurels. The Eton Mission Hall at Hackney Wick, the addition to King's College, Cambridge, and the restoration of the library at Christ's College, and many other buildings, show the same delicate care, the same longing for simplicity, truth, and repose. The Deans and Chapters of York and Peterborough may be congratulated on having called in Mr. Bodley to take charge of the repairs in their cathedrals—repairs under which such delicate questions arise between the antiquary, the pure artist, and the practical architect. Mr. Bodley has also shown great power in carrying out decorative work, both in colour and in that of a monumental kind. Of the latter I need only mention the tomb of Archbishop Thomson at York, showing great power of design and wonderful care, even to the most minute detail. He has shown also in colour the intense knowledge he has of its value when properly applied, and he has also shown how to handle it. I should be inclined to place this knowledge and management of colour as perhaps the highest of his artistic faculties. It is, therefore, with feelings of great pleasure that I have the honour of presenting the Royal Gold Medal to Mr. Bodley, and I am sure that all our members feel also the honour of having such a distinguished artist among us. The Chairman then, amid hearty and prolonged cheering, invested Mr. Bodley with the blue ribbon and medal.

Mr. BODLEY, who was most cordially received, observed that, for more reasons than one, he felt utterly unprepared to express his thanks that night. Not being familiar with their routine, he had been labouring under the mistake that he was to attend an annual club dinner that night, and that he should there derive inspiration to acknowledge the presentation, which would, he thought, take place the following evening. The honour they had just conferred on him was absolutely unexpected. He was afraid he had not in the past been quite respectful towards the Institute, for it was not many years ago since he took part with his friend Mr. Thomas Jackson and others in writing papers in which they argued against examinations being regarded as a test for forming architects. He still felt that the examination principle had one failing, and that was that it was only too likely to make an architect less of an artist, and to make his work less of an art and rather too much of a profession. He supposed he owed the honour just conferred upon him perhaps more especially to his love for what he held to be the most beautiful of all styles—English Gothic (Applause), and he did not think that the great value of the simplicity and refinement characteristic of our English Gothic architecture was fully realised. He for one believed that even in these days the more they were able to hark back to one style the better it would be for our national art. Style in architecture was, after all, only the language in which they strove to express to the world their ideas. Of late years our buildings had grown higher and higher, but had they grown correspondingly in refinement and nicety?—for these were the qualities that constituted art. He could only say he was very much obliged to the Council of the Institute for their award, and would thank the members for their hearty reception that evening. (Loud cheers.)

## THE KING IS DEAD: LONG LIVE THE KING!

Mr. ASTON WEBB, A.R.A., proposed a cordial vote of thanks to Professor Aitchison for his conduct in the chair during the past three years, referring, in well-chosen terms, to the good temper and good nature with which he had presided over the meetings, and said that his presidential addresses and those to the students showed much thought, great research, and wide archaeological learning, and withal a readiness to welcome the newest building materials and methods. The past three years of the Institute had been none the worse for being uneventful, for they did not always want to be reformed. The Institute had

been consulted by the Government as to their new offices, and during the President's term a new schedule of charges had been promulgated, but with, alas! no increase in the scale of charges.

Mr. H. H. STATHAM, in seconding the motion, referred to the addresses given to the Academy students by Professor Aitchison, and expressed a wish that they might be published in a separate volume.

The vote of thanks was passed by acclamation, and the chairman then introduced to the meeting the President-elect, Mr. William Emersor, who was received with cheers.

Mr. EMERSON said he was glad to find that he had filled the post of honorary secretary for a good many years, evidently to the satisfaction of members, otherwise they would not have elected him to the chair. When he thought of all the eminent and scholarly men who had occupied the post he was invited to hold, he was impressed with the difficulty of keeping up the standard; but he trusted with their kind consideration of all his actions to be able to discharge his duties honourably.

## THE INSTITUTE DINNER.

THE annual dinner of the Royal Institute of British Architects was held on Tuesday night at the Hôtel Métropole. Mr. W. EMERSON, the newly-elected President, occupied the chair, and among those present were the Bishop of Ely, Sir R. Temple, Sir W. B. Richmond, R.A., Mr. F. C. Penrose, Mr. C. Barry, Dr. Church (President of the Royal College of Physicians), the Dean of St. Paul's, Sir John Taylor, Mr. E. A. Waterlow, A.R.A., Mr. B. Margetts, Mr. Alderman Hind (Master of the Plumbers' Company), Mr. T. M. Rickman (President of the Surveyors' Institution), Mr. T. W. Russell, M.P., Mr. R. Strong (Vice-Chairman of the London County Council), Sir A. R. Binnie, Mr. W. M. Fawcett, the Dean of Westminster, Mr. G. F. Bodley, A.R.A., Sir H. Trueman Wood, Archdeacon Sinclair, Mr. T. Drew (President of the Royal Institute of Architects of Ireland), Mr. Ernest George, Mr. J. M. Brydon (Vice-President), and Mr. A. Graham (honorary secretary). Mr. ASTON WEBB, A.R.A., proposed “The Houses of Parliament,” and acknowledged the courtesy of the Government in consulting the Institute in respect to the new Government buildings at Westminster. The BISHOP OF ELY acknowledged the toast on behalf of the House of Lords. Mr. T. W. RUSSELL, responding for the House of Commons, said there were two questions—and neither of them Party questions—in which that Institute was interested, and which he hoped would be settled before this Parliament came to an end. The first was that of the housing of the working classes. No patriotic man could look with complacency upon things as they were at present, when masses of people in many places were living in a way that no gentleman would like his horses or his dogs to live. It was the duty of Parliament to face an issue like this, and face it promptly. The next question was equally a non-Party question; he referred to the amendment of the Public Health Acts. Much was being done under the Acts as they stood now; but as the years had gone by the defects in these Acts had been proved, and it was high time Parliament again faced the question of public health, and placed facilities in the hands of public bodies in this country for doing all they could to insure the health of the people. “Art and Science,” submitted by Mr. W. M. FAWCETT, was replied to by Mr. E. A. WATERLOW (President of the Royal Society of Painters in Water-Colours) and Sir A. R. BINNIE. Sir RICHARD TEMPLE proposed “The Royal Institute of British Architects and the Allied Societies.” The PRESIDENT, in replying, said they now had a compulsory examination for Associates of their Institute, and very severe tests were imposed upon young men before they could be elected to that position. With regard to the growing influences of their Institute, the Government had during late years consulted them on a number of important points, and the objects of the founders were gradually being carried out. When the Institute was founded there were 170 to 180 architects in London. At the present moment there were over 1,400. There were in the year the Charter was granted to the Institute 81 Fellows in the Institute and 20 honorary members; there were now 1,616 members and 125 honorary members. Mr. T. DREW also responded. Mr.

J. MACVICAR ANDERSON, past president, gave "The Guests," and the DEAN OF ST. PAUL'S replied.

#### BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

AT a general meeting on Tuesday last, an election of a pensioner took place, the president, Mr. Alfred F. Randall, in the chair. The candidates were Mrs. Amy Hankins and Mrs. Fanny Hicks. After the close of the pole, the chairman declared Mrs. Hankins elected by a majority of 252 votes.

#### BOOKS RECEIVED.

*Inwood's Tables of Interest for the Purchasing of Estates, &c.*, by WILLIAM SCHOOLING, F.R.A.S. (London: Crosby, Lockwood, and Son).—This well-known and authoritative work by Inwood has been remodelled and extended by Mr. William Schooling, and to it are added logarithms of natural numbers and various tables. These tables are collected and arranged in logical order, and so placed that they can be seen at one opening. Six other rates have been added to the rates of interest previously given. To all architects, surveyors, and valuers of property, and to many others, the work will be found of great value, and Mr. Schooling's revisions and additions to the work make it as perfect as a work of this character can possibly be. There is an admirable and clearly printed table of contents, and the introduction on the use of decimals, interest tables, present value of a perpetuity, renewal of leases, value of annuities, &c., is concise and useful. The tables are very clear, and are good, excellent specimens of typography.

*Greenwood's Timber and Stone Calculator* (Manchester: Baxendale and Co.) is invaluable to all architects, surveyors, valuers, contractors, timber and stone merchants, and will save many a long, tedious calculation. For building estimators and quantity surveyors the "Calculator" will be a priceless boon. The author shows, amongst other things, how to check a timber merchant's invoice. The "inch by inch" method of measuring timber is useful. These rules are illustrated by examples. For determining the price of small-size timber, Mr. Greenwood's "Calculator" is of much value. The price of the book is only 1s. 6d., post free, and it is well worth its weight in gold.

*Haddon Hall* (Bakewell: C. C. Wardley).—Mr. F. H. CHEETHAM has published in a shilling handbook some notes on the architecture and history of the historic home of the Peverels, Avenals, Vernons, and Mannors', in which he endeavours to render intelligent to the ordinary tourist the significance of the mansion as an architectural work. He admits that it is not possible to speak with any certainty about Haddon Hall much before the 16th century, and, of course, declines to accept the story of the romantic wooing and flight of Dorothy Vernon. He quotes from Morrison Marnock's article on the woodwork of the hall, published in the *BUILDING NEWS* in 1875. The book is illustrated by a block and detailed plan, both by the writer, and also by many sketches, some by Mr. Cheetham and others by Miss Josephine Harris.

*Modern Drainage Inspection*, by GERARD J. G. JENSEN, C.E. (London: Sanitary Publishing Co., 5, Fetter-lane), is a report of a series of articles from the *Sanitary Record*, revised and rewritten, intended for the use of sanitary inspectors and householders. Over a hundred woodcuts are given as illustration of various points.

*The Essex Review* (Chelmsford: E. Durrant and Co.).—The new quarterly part of this excellently written and readable county magazine contains a full-page view and wood-blocks and description of Blackmore Church, by Fred Chancellor, J.P., F.R.I.B.A.; "The River Roding: its Glory and its Abasement," by W. W. Glenny, J.P., illustrated by numerous reproductions of photographs; and an account of "The Furley Family," by Dr. Gibbins.

*Meisterwerke der Baukunst und des Kunstgewerbes*, by HERBERT GOLEY (Leipzig), Part I., deals with Italian buildings and sculpture.

*Applied Geology*, by J. V. ELSDEN, B.Sc., Lond., F.G.S. Part II., with illustrations. (London: "The Quarry" Publishing Co., Ltd., Arundel-street, W.C.) This little book is written for both geologists and practical men. Mr. Elsdon endeavours to point out the connection between geological theory and its application to industrial

pursuits or economic geology. A general glance through the chapters of this book shows that the author has been successful in combining the two aspects. The previous volume we noticed. This one commences with Chapter VI., on Unstratified Ore Deposits, and gives sections to show mineral veins in these deposits, fissures, lodes, the varying widths of a lode traversing beds of unequal hardness. The illustrative sections are well drawn, and explain every variety of veins. Non-metalliferous minerals are next described. The most interesting chapters are those on "Building and Ornamental Stones." The author describes the principles of rock weathering, the agencies of weather and frost. The conditions which affect durability are next treated; and the chapters dealing with granites, porphyries, syenites, those of sedimentary origin like sandstones, calcareous stones like limestones and marbles, are of much value to the architectural student. The remarks on bedding and dressing stones, tests, &c., are worth reading. The series of sections of rocks, and of each stone, are very complete.

*The Cathedral Church of Durham*, by J. E. BYGATE, A.R.C.A. (London: George Bell and Sons), is another little handbook of Bell's Cathedral Series, which we have noticed from time to time. The objects of the editors of the series have been kept in view in this volume on Durham. The writer has a personal knowledge of the edifice, and he has consulted Canon W. Greenwell's work. The author has also made drawings and measurements and given some careful sketches, while the photographic reproductions are, as usual, by the Photochrom Co., Ltd., and Messrs. S. B. Bolas. The chapters treat on the building of the church, and the description of the various features of exterior and interior. The position of Durham Cathedral is unique, built as it is on the summit of a wooded hill which rises from the River Wear. Excellent views are given of the exterior; one bay of nave measured and drawn by the author showing two Norman arches and triforia, &c., embraced under one sexpartite bay of vaulting; also views of the choir, transepts, triforium of nave and choir, the famous chapel of the Nine Altars, with St. Cuthbert's tomb, and the Galilee or Lady-chapel. There are also numerous sketches of details by the author, and a reproduction of an oil-painting by him, showing a general view of cathedral over the tiled roofs of the city from the north, as seen through a veil of smoke and mist. A good plan is appended, which adds much to the value of the handbook as a guide to visitors.

*Spon's Architects' and Builders' Price Book*, by W. YOUNG, architect, twenty-sixth edition (London: E. and F. N. Spon, Strand).—This is a revised and enlarged edition of a well-known price-book. The matter arranged alphabetically gives this handbook of prices and memoranda an advantage over other books. The book is really half a textbook, comprising data and formula, and half a price-book. This edition includes a chapter on electricity, with specification and estimates for electric-light installations, also information on lightning conductors, electric bells, concrete, fireproof floors, &c. The Workmen's Compensation Act, 1897, is a useful addition. We can recommend the work to all architects and builders who require memoranda and prices combined.

*Conflagrations During the Last Ten Years* (London: 1, Waterloo-place, Pall Mall).—Under the auspices of the British Fire Prevention Committee, Mr. CHARLES E. GOAD, Man.Soc.C.E., has republished in book form a paper recently read before the Insurance Institute of Manchester. The subject is elucidated by twenty-three coloured maps showing the scene and extent of the large outbursts of fire, and by several block illustrations. The book is edited, and contains a preface written by Mr. Edwin O. Sachs, chairman of Executive of the Council.

*Sanitary Engineering of Buildings*, by WM. PAUL GERHARD, C.E., Consulting Engineer, &c., Vol. I., with illustrations and plates (New York: William T. Comstock).—This well-bound volume is an expansion of numerous separate articles, &c., contributed by the author to technical journals. The "Hints on Drainage and Sewerage" by the author have been re-written and brought up to date, and the volume is full of new illustrations. This volume treats of defective plumbing, traps and systems of trapping, drainage of buildings, fixtures, sewage removal, the principles of scientific house drainage and plumbing, improved methods, and consists chiefly of separate essays on these subjects. Many useful remarks and suggestions are given, and we should say Mr.

Gerhard's useful work will be found of service, not only in his own country, but also on this side of the Atlantic. The second volume is intended to deal with special applications—domestic appliances, water-supply, suburban and country-house sanitation, plumbing of hospital buildings, theatre and school sanitation, kitchen and laundry arrangements, baths, &c. The volume is well printed and illustrated.

*Water-Supply and Sewage Disposal in Rural Districts and Plumbers' Work*, reprinted from the *Lancet* (London: offices of the *Lancet*) contains a reprint of the report of the *Lancet's* Special Commission on the relative cost and efficiency of plumbers' work. This work will be found to be a useful compendium of the faults to be found in plumbing-work. The three typical examples given in the report of houses that require remodelling are useful, especially the estimates of costs appended. The terrace houses illustrated are of the kind to be found in our London West-end squares; plans are given, and the relative cost of defective arrangements and sanitary arrangements are shown. The results of the inquiry undertaken by the *Lancet's* Commission point to various evils, such as the system of contracting, which makes the interests of the architect and builder different or opposed; scamped work is the result. The wants of a standard of prices based on sound work for arbitration purposes, the excessive charges made by plumbers, and, in support of the latter contention, the report observes: "The work of renewal, especially in the larger houses situated in a terrace, entails a vast amount of labour, not only in the actual plumbing and drainwork, but in alteration and reconstruction, if the work is to be carried out in accordance with the conditions of modern sanitary knowledge. It is also noticed that the fittings and materials throughout are costly, and the plumber receives 1d. per hour more than other mechanics in the building trades—viz., 10½d. per hour." Unprincipled plumbers take advantage of these facts, and make exorbitant charges. The suggestions given under each of the examples, with recommendations as to details, illustrated by sketches and diagrams of fixtures, will furnish a guide to those who have sanitary work to be done. The plans and reports are more practical than many treatises, and offer a summary of the system approved by the highest authorities. The detailed estimates and recommendations, which latter form a specification for each of the uses illustrated, will be found of value to the architect and builder.

*Selected Examples of Decorative Art from South Kensington Museum*, edited by F. E. WITTHARES, Part 5 (Longmans, Green, and Co.).—This part comprises a dozen plates of subjects of considerable value and interest to architects and decorative designers. A very fine example of a carved walnut panel, Spanish 16th-century, in the South Kensington Museum is given, simple and quiet in treatment and in bold relief. A carved oak coffer or font, French of the same period, shows a flat geometrical design in the panel. Gesso-work is represented by a circular wooden frame, relieved by gilded gesso relief of Italian 15th-century design. A lavabo of Istrian stone, Italian, is interesting as a design of refined character. Next we have an example in cut leather of a "chair back," Portuguese in design, latter part of 17th century, a very beautiful specimen of flat foliage in leather. In bronze work a few choice examples are given, cast bronze escutcheon of door handle, German 12th century, a ewer of gilded and silver bronze, a bronze aqua-manile, also German; fine bronze knockers, Italian figure subjects. Glass is represented in some unique Venetian wine-glasses of peculiar design in the stems. A fine chrisimatory of silver-gilt, German 15th century, and a cruet of the same material and style, and a silk tunic of embroidered silks, and silver-gilt threads and spangles, English, latter part of 16th century, are also illustrated in this valuable series of decorative art examples.

*Handbook of Saw Mill and Wood-Working Machinery*, by M. POWIS BALE, M.I.M.E., &c. (London: William Rider and Son, Limited).—This is a volume in "Rider's Technical Series," and from the author's known experience and skill in this class of machinery, is a book that can be safely recommended to all engaged in wood-working machinery, or who are about to select machines. The chapters deal on the arrangement of mills, machine foundations, and will therefore be of value to architects and others engaged in mill-building. The advice

given on modes of construction, speeds, and other points of wood-working machinery will find Mr. Bale's book invaluable. Every class of machine is described, and their main points dealt with.

## CHIPS.

On Saturday the new section on the Royal route from Blairgowrie to Braemar at Strone of Cally, about six miles north of Blairgowrie, was opened to traffic.

In the Chancery Division on Tuesday, Mr. Justice Cozens-Hardy made a compulsory winding-up order in the case of the N.A.P. Window Company (Limited).

The new church in St. Philip's district of the West Bromwich Christ Church parish was opened on Sunday. It is situated on the Beeches, and capable of accommodating 750 persons. The estimated cost was £6,000, but owing to the lack of funds the major portion only has been erected, at an estimated outlay of £4,000. The work has been executed by Mr. John Dallow, the architects being Messrs. Wood and Kendrick.

The total of last week's sales at Tokenhouse-yard, amounting to £225,302, was fairly satisfactory, though this was some £2,000 below the corresponding week of last year, a deficit due to the short supply of property. Reliable investments well maintained their value, and residential properties met with a certain amount of success.

The harbour board of Dundee, who last year raised the salary of their engineer, Mr. G. C. Buchanan, from £400 to £450 a year, decided on Monday, after a long discussion, to further increase it to £600 per annum.

The Catholic Apostolic Church, Cromer-road, Leeds, has been decorated throughout under the direction of Mr. Jas. W. James by Mr. Herbert C. Oakley, of Leeds. New brass fittings for the choir have been executed by Messrs. Jones and Willis. The general work of painting and decorating has been carried out by Messrs. W. Walsh and Sons, Wade-lane.

On Saturday the memorial-stone was laid of a new Free Church being erected in Grace Drive, Linthouse, Govan. The church, seated for a congregation of over 1,000, will be fully equipped with halls, session-house, &c., and the total estimated outlay, including site, is £7,800. The chief contract, that for masonry, has been taken by Mr. Michael Alexander.

At Gorton, near Manchester, on Saturday, memorial-stones were laid of new schools in connection with Brookfield Unitarian Church. Messrs. T. Worthington and Son, of Manchester, were the architects, and Mr. Robert Carlyle, jun., is the contractor. The buildings, which cost £7,300, harmonise with the adjoining chapel, and will be constructed of porpoise stone, with ashlar dressings.

The London County Council considered, on Tuesday, a report of the improvements committee recommending the carrying out of an improvement in Westminster, which included the extension of the Thames Embankment from the Victoria Tower Garden to Lambeth Bridge, the widening of Millbank-street, and the laying-out as a public garden of the land between the river and Millbank-street. Several amendments, designed to shelve the question, were rejected; but on one being submitted making the carrying out of the project subject to a substantial contribution being made by the Government, the debate was adjourned.

Sir Courtenay Boyle heard, on Tuesday, the objection of the Leigh Urban District Council to the confirmation of the order for the making of about six miles of light railway in Southend and the Leigh urban district. The corporation of Southend were the promoters, and the urban district council wanted the Board of Trade to insert a clause binding the promoters to widen a road to a minimum of 23ft., and to complete the whole of the light railway within three years. The corporation objected to widening the road for the benefit of the urban council. Sir C. Boyle adjourned the inquiry for the parties to come to some agreement.

On Sunday there was dedicated the new stained-glass window placed in the east end of the chancel of Cannock Parish Church as a memorial to the late Mr. Samuel Loxton. The window consists of three lights, surmounted by two quatrefoils, and in the apex a trefoil. The central figure is that of our Lord, clad in the red robe and the white robe. Beneath His feet is the rainbow spanning the empty cross, beside which are kneeling two cherubim. Over His head are cherubim, bearing a celestial crown. In the light to the spectator's left are the figures of Moses and David, and on the right St. Luke and St. John. Under these side figures are representations of the Ark and the Covenant, the scroll of the Psalter, the Ox, and the Eagle. The artist is Mr. Samuel Evans, Smethwick and Liverpool.

## Building Intelligence.

**BETHNAL GREEN.**—A new workhouse infirmary is about to be built on the site of Palestine-place and grounds from plans prepared by Messrs. Giles, Gough, and Trollope, of Craven-street, Strand, at a cost of over £198,307 (inclusive of £35,500, the cost of site). The infirmary will eventually provide accommodation for 750 beds. The work is being carried out in sections. Running the length of the site is a main corridor 760ft. in length, and a deviation is made to allow of its passage through the administrative block, which occupies the central position. Provision has been made here for the matron, medical officers, and staff, and there are also the kitchen, scullery, laundry, mortuary, and stores. The building work of the first section has been entrusted to Messrs. Rowbottom, of Birmingham.

**BRISTOL.**—The new isolation hospital at Ham Green is to be opened for the reception of patients on the 17th July. About twenty acres of the Ham Green estate are appropriated to hospital purposes, providing ward pavilions for 185 patients. The buildings at present erected consist of four pavilions and an isolation ward, providing accommodation for 76 patients. Each of the ward pavilions contain two large wards 48ft. by 26ft., and 14ft. in height, one single-bed ward, nurses' room, bathroom, and offices. In front of each ward is a verandah 18ft. wide, and running the entire length. The walls of the building are of brick, the floors are laid with pitch pine blocks, and the wards are plastered with cement and painted. The plans were prepared by the city engineer, and the cost has been from £28,000 to £30,000.

**CHALFONT ST. PETER'S.**—The Duke and Duchess of York visited Chalfont, Bucks, on Friday, to open four of the new homes built there for the use of epileptics. The Duke spoke highly of the work of the Society for the Employment of Epileptics, by whom the homes were founded. He referred to the distressing nature of the malady from which the patients suffered, and expressed a hope that the result of the Society's efforts would be an amelioration of the condition of these unfortunate people. The Milton and The Pearman Homes for 48 children were erected by Mr. J. Passmore Edwards; the plans and perspectives appeared in the BUILDING NEWS for June 25, 1897. The Greene Home for 24 men (illustrated in our issue of July 29, 1898) has been built by Mr. Richard Greene, and the Isolation Home (shown in our pages by a photo-lithographic plate on Feb. 25, 1898) has been erected at the cost of Mrs. Dearmer. Mr. Maurice B. Adams, F.R.I.B.A., is the architect of all these buildings. Mr. Passmore Edwards has promised an administrative central building, and a convalescent home is about to be erected.

**CHESTER.**—The foundation-stone of the new stands which the Chester Race Committee are erecting were laid by the Duke of Westminster on Saturday. The county club stand will occupy the site of the old stand, and extend over a portion of the previous Tattersall's ring. It will be in the half-timbered style, in keeping with the Chester buildings, and will contain a saloon about 80ft. in length. In front will be a covered promenade, which will be reached from the course by a broad flight of steps. Below the saloon will be dining-rooms, kitchen, telegraph office, stewards' private rooms, and offices for the secretary, clerks, directors, &c., and behind it will be the ladies' retiring rooms, refreshment-bar, &c. The main entrance will be on the ground level at the end of the old carriage drive. The stand will cover an area of 140ft. by 60ft. The walls will be built of Ruabon bricks, and the roofs covered with red Ruabon tiles. Over the covered promenade, which will be 100ft. long, will be an open balustrade. The fittings will be of pitch-pine, with tiled corridors. Immediately adjoining the County Club stand will be Tattersall's stand, which will be 92ft. in length and about 35ft. in breadth. It will be supported on iron columns and roofed with red-tiles, and the front will, like the County stand, be in the half-timbered style. In front of the stand, and running its whole length, will be a flight of stone steps with a tiled roof for protection from the rain. In this stand also there will be a dining-room and refreshment-bar on the level. Separated from Tattersall's stand by an exit passage, and brought a little forward so as to follow the line of the course, is the grand stand, which is 80ft. long by 35ft. wide. The new stands will provide about three

times the accommodation that the old stands did. The architects are Messrs. Mangnall and Littlewood, of Spring Gardens, Manchester, who designed the stands at Haydock, Hooton, and other racecourses. The contractors are Messrs. Parker Bros., of Chester; and Mr. Joseph Davison, of Manchester, is the clerk of works.

**JEWIN-CRESCENT, E.C.**—Nos. 19, 20, and 23, Jewin-crescent are in course of construction by Messrs. J. Simpson and Son, of Paddington-street, Marylebone, in accordance with the designs of Mr. Benjamin Tabberer, F.R.I.B.A. All the floors and roofs are constructed of iron and concrete; the iron girders and columns are protected by asbestos and other fireproof plaster, and all the stairs are built of artificial stone, which has been proved to possess fire-resisting power superior to natural stone. The staircases are inclosed by 9in. partitions of white glazed bricks. Skylights in the roofs and areas have been abolished (these having furnished ready means of fire extension), and the old "back-yard" has been reinstated. The walls behind the back areas are hung with white enamel tiles. Where wood is indispensable, as for doors, shop-fronts, and window-frames, teak has been used. Partitions inclosing the lavatories on half-landings are constructed of Bruckner's fireproof plate-wall patent. Electric mains will be provided to all the landings. The principal piers on ground and first floor are faced with Farnley glazed bricks, the lower portion being brown, and the upper a blue-grey. The remainder of the front is constructed of Imperial stone and red Fletton bricks.

**LIVERPOOL.**—The restoration of the St. George's Hall pediment is now completed, and in the course of a week or two the scaffolding will be removed. In the mean time some renovation is necessary to the cornice surmounting the group. When this has been accomplished, the sculptures will once more be unveiled to public view. An instance of the thoroughness with which all the sculptured decorations on St. George's Hall were originally carried out is afforded, says the *Liverpool Mercury*, by the carved details on the mouldings and on the soffit of the pediment cornice. Almost completely hidden by shadow, and quite impossible to be clearly seen from the street, is an extraordinary amount of carefully-cut ornament—so carefully done, in fact, as to be worthy a place on parts of the building more available to the eye. Why such evidently costly but comparatively ineffectual adornments were introduced is difficult to imagine, unless it was due to the designer's respect for purity of style in reproducing Classic forms.—The Unitarian Chapel in Ullet-row, Sefton Park, was opened last week. It will accommodate 440 worshippers, and has been built externally of Runcorn stone and Ruabon brick. Internally it is completely lined with Runcorn stone. The church consists of a wide nave, which contains the whole of the seating accommodation, and a chancel with semi-octagonal termination and organ-chamber. A projection on the north side forms the organ-chamber, and some low buildings on the south side contain vestries and a congregational hall, with accommodation for Sunday-schools, and filling three sides of a quadrangle. Messrs. Eary and Hobbs, of London and Manchester, have executed the carving work in stone and a portion of the woodwork. The architects are Messrs. Thomas Worthington and Son, Manchester; the contractors Messrs. W. Tomkinson and Sons, Liverpool; and Mr. J. Clydesdale has acted as clerk of works.—The open-air baths for boys in Mansfield-street, off St. Anne-street, were formally opened by the Lord Mayor last week. The establishment covers an area of 1,875sq.yd. The gardens have an area of 825sq.yd., and are laid out with walks and grass. The bath and gymnasium cover an area of 1,050sq.yd. The swimming-bath is 75ft. by 30ft., 3½ft. deep at one end and 2½ft. deep at the other; it contains 42,200 gallons of water. It is supplied with fresh water from the corporation mains, heated by means of a circulating heating system, and can be maintained at a temperature of 75° to 80° Fahr. at an exceedingly small cost. The establishment was designed by the bath's engineer, Mr. W. R. Court. The contractors for the work were Messrs. L. Marr and Sons, Liverpool, and the cost £3,000.

**LYNTON, NORTH DEVON.**—Through the generosity of Sir George Newnes, a town-hall and reading-room are being built in this watering-place. The architects are Messrs. Read and

Macdonald, of Bond-street, London, and Jones Brothers, of Lynton, are the contractors; Mr. Bob Jones, who takes the superintendence, was joint engineer with Mr. Frank Chanter of the Lynton and Barnstaple Railway. Local stone is being used for the building of the town-hall, with Bath-stone dressings, the woodwork being almost wholly of oak. The style is Elizabethan, a feature of the exterior being the half-timber work on the upper part of the balcony level. The vestibule in the front centre of the building is approached by a few broad steps. This leads into the entrance-hall, from which an oak staircase of two flights leads into the town-hall, running the whole length of the building. It will accommodate over 500 persons, having a platform at one end and a retiring-room off the platform. The roof is a carved, open one, with cornices and wainscot panelling in oak. There are four dormer windows, leaded lights distinguishing the whole of the building. An ante-room leads off the town-hall, with emergency steps in front leading down to the eastern end. In the centre of the front of the building is a gallery. The council chamber, for the meetings of the urban district council, is on the left, on the ground floor, together with cloak-rooms and the offices for the clerk and the surveyor. On the right are the caretaker's room, and also the recreation-room, which will be occupied by the institute and the reading-room. The walls inside are lined with panelled oak; the floors are fireproof. The building will be completed in May of next year.

NEWCASTLE-ON-TYNE. — A branch bank in Elswick-road has just been opened for business. The building comprises bank, manager's room, strong rooms, and a manager's house of 10 rooms. The bank and manager's room are fitted up in oak, and the walls finished in Albino cement. The general contractors were Messrs. I. and W. Lowry, of Newcastle. The fireproof and wood block floors are by Messrs. Mark Fawcett and Co., of Westminster. Another branch at the Cattle Market has been rebuilt and recently opened for business. It comprises bank, manager's room, strong rooms, and six rooms for offices. The buildings were erected by Mr. W. C. Tyrie, contractor, of Gateshead. The tender of Mr. C. Groves, of Chester-le-street, has just been accepted for the erection of a branch bank and other buildings at Consett, Co. Durham. The whole have been designed by Mr. John W. Dyson, M.S.A., of Newcastle-on-Tyne, architect for Messrs. Lambton and Co., bankers.

PENLEY, SALOP. — The pulling down of the old church preparatory to the building of the new one has been begun this week. The present church, built in 1794, still contains the old-fashioned high-backed pews facing different ways, a large gallery, and a three-decker pulpit. The new church, which will be built on a site at the back of the present one, is to be of stone, and capable of seating about 150 people. The architect is Mr. C. Hodgson Fowler, of Durham, and the work is being carried out by the Gredington Estate workmen, under the supervision of Mr. T. G. Boscawen, Lord Kenyon's agent. While the church is being rebuilt the old hall is also to be restored. Penley Hall, the seat of the ancient Dymock family, has been untenanted for many years. With Mr. Robert Middleton Dymock, of Ellesmere, who died recently, the name of Dymock has died out, and the ownership of the estate has passed into the hands of his nephew, Colonel Vaughan, of Bath. Colonel Vaughan intends rebuilding the old hall, and restoring it to its former dignity. With this view, Mr. T. G. Boscawen, the agent for the estate, has placed the first portion of the contract in the hands of Messrs. Davies Bros., of Wrexham.

PLAISTOW. — New public baths are being built by the West Ham Corporation in Balaam-street, Barking-road, Plaistow. The buildings are being erected at a contract price of £22,308 by Messrs. Spencer, Sinto, and Co., of Westminster, from plans prepared by Mr. A. Saxon Snell, F.R.I.B.A. They will have a frontage of 126ft. to the road, and will provide first-class men's swimming bath, with water area of 100ft. by 37ft., and from 6ft. 6in. to 3ft. 6in. in depth; second-class men's swimming-bath, with water area of 60ft. by 20ft., and from 6ft. to 3ft. in depth; a clubroom to each bath; five first-class men's warm baths, twelve second-class ditto, five first-class women's warm baths, five second-class ditto, committee-room, ticket office, superintendents' office, superintendents' apartments, with two sitting and three

bedrooms, and a kitchen and bathroom, &c., towel laundry and towel store, boiler-house, engine-room, coal stores, waiting-room to each department, and entrance-hall. The first-class swimming-bath is to be fitted with sixty-two separate dressing-boxes.

ROYAL LONDON OPHTHALMIC HOSPITAL. — The new buildings of this hospital, opened on Tuesday by the Duke and Duchess of York, have been erected on an irregular-shaped piece of land some 35,000ft. in area, have frontages to City-road, Cayton-street, and Peerless-street, from the designs of Messrs. Keith D. Young and Henry Hall, and have cost £80,000, provided by the sum received for the site of the old building in Broad-street and public subscriptions. The hospital contains 140 beds and 105 rooms, excluding the basement, and special arrangements have been made for accommodating an increased number of out-patients. The building has been designed in a somewhat French type of Renaissance, and is faced with Portland stone, with a handsome porch occupying the centre of the front. The construction of the building throughout is fireproof, the floors being formed of iron girders protected by terracotta tubes (Fawcett's patent system), and covered with coke breeze concrete, and all the partition walls are either of brick or hollow terracotta tiles filled with concrete. The corridor floors are finished either with terrazzo or with artificial stone, and the staircases are made of cast concrete with iron joists imbedded therein, while the ward floors are laid with teak boards side nailed direct to the concrete. The fireplaces throughout are provided with grates of the Teale pattern. The whole of the engineering work in connection with the warming and ventilating has been carried out by Messrs. Ashwell and Nesbitt, of Great James-street, Bedford-row, W.C., whose Leicester Plenum system has been adopted.

ST. PAUL'S CATHEDRAL. — Two massive candelabra will shortly be placed in position at the entrance to the nave of St. Paul's Cathedral. One of the bronze pieces is the gift of Mr. Douglas Murray, in memory of his father, a Prebendary of the Cathedral; and the other has been presented by the members of the decoration committee. The subject matter has been taken from the first chapters of Genesis, the underlying motive being *Benedicite, omnia opera*. At the angles of the base the white, yellow, and black races of mankind are represented by three figures. On the sides of the base, in low relief, are represented "Sin" — Eve eating the forbidden fruit; "The Punishment" — Adam's mortality implied by his labour; and "The Atonement" — Christ's crucifixion. Beasts and birds occupy positions beneath the earth, which is covered with flowers and girdled by the sea. The firmament is represented by a fiery column, around which angels are moving. Above are archangels, who support the rose, from which springs the cross, surrounded by stems for the lamps. The candelabra are mounted on massive slabs of Irish fossil. The candelabra were designed by Mr. Henry Pegram, of Norfolk-road, St. John's Wood, and were cast by Messrs. Hollinshead and Burton, of Thames Ditton.

Three memorial windows have been fitted up behind the pulpit of Inverbrothock Free Church, Arbroath. The subjects are "The Nativity," "The Ascension," and "The Crucifixion." The windows were supplied by William Pearce, Ltd., Birmingham.

The iron girder bridge which for the past 42 years has carried the double line of the East Suffolk Railway over the Norwich-road, Ipswich, has just been replaced by a new structure. The contractors were Messrs. Butler and Co., of Stanningley Iron-works, Leeds, represented on the site by Mr. Thomas Patchett. The new bridge, which weighs 47 tons, was built alongside the old one on the west or Whitton side, and was moved into position on Sunday, in the presence of Mr. H. Jones, district engineer to the Great Eastern Railway.

King Arthur's Castle Hotel, at Tintagel, North Cornwall, was opened on Friday. It is situated on a hill, above the village and facing the sea, the view from the front taking in the ruins of King Arthur's Castle, which lie to the left. The structure is a substantial one, built in castellated form to harmonise with the traditions of the surroundings. The furnishing has been done by Messrs. Waring and Co., of London, and the hotel is electrically lighted, and supplied with good water. Mr. S. Trevall, of Truro, is the architect, and the building contract has been carried out by Mr. Carkeek, of Redruth.

## PROFESSIONAL AND TRADE SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS. — The council of this society have already arranged the programme for the coming session, 1899-1900, as follows: — Oct. 10, annual dinner; Nov. 14, lecture, "Some Old Derbyshire Houses," by J. R. Wigfull, A.R.I.B.A.; Dec. 12, lecture, "Oriental and Indian Architecture," by Professor T. Roger Smith, F.R.I.B.A., of London; Jan. 9, 1900, lecture, "Suggestions for dealing with the Law as to Light and Air in Building Cases," by T. Walter Emden, J.P., P.S.A., of London; Feb. 13, lecture, "A Parish Church," by C. Hodgson Fowler, F.S.A., of Durham; March 13, lecture, "The Architecture of the 15th Century and Early Tudor Period," by C. M. Hadfield, A.R.I.B.A., of Sheffield; April 10, annual meeting, election of officers, &c. It is also hoped to arrange during the present summer excursions to Derwent and Langsett.

## CHIPS.

M. Guillaume, the director of the French School of Art in Rome, is about to retire. The well-known painter, M. Bonnat, professor and master of the schools at the Beaux-Arts, will probably be his successor at the Villa Médicis.

The death occurred on Friday of Mr. James Duckett, of Woodleigh, Burnley, brick and tile manufacturer. Mr. Duckett, who was 73 years of age, was for several years a member of the town council, and was made a magistrate in 1884.

An interesting archaeological discovery was made on Wednesday week in the Forum on the site of the basilica Emilia, now being excavated by the Italian Government, under the direction of Signor Giacomoni, in consequence of the munificent gift of £2,400 recently made by Mr. Lionel Phillips, through the instrumentality of Mr. St. Clair Baddeley. The excavators have discovered the top of a magnificent column of Phrygian marble, 4ft. thick, standing apparently *in situ*. The column is believed to form part of the original structure of the basilica.

Messrs. Briggs and Wolstenholme, architects, Liverpool and Blackburn, are acting jointly with Mr. Thomas E. Murray, architect, in the carrying out of the new school board offices for the Tottenham School Board, referred to in our last week's issue.

The West Bridgford Urban District Council having applied to the Local Government Board for sanction to borrow £4,455 for purposes of sewage disposal, Colonel J. T. Marsh, R.E., one of the Board's inspectors, held an inquiry into the application last week. Mr. A. J. Martin, engineer, and Mr. W. Pare, surveyor, explained the plans.

The Board of Trade have confirmed an order authorising the construction of a light railway between Axminster, in the county of Devon, and Lyme Regis, in the county of Dorset.

The Victoria Tower, built on Castle Hill, Huddersfield, to commemorate the Diamond Jubilee, was opened on Saturday afternoon by the Lord Lieutenant of the West Riding, the Earl of Scarborough. The tower has cost over £3,000. It is built of Crossland Hill stone, is 20ft. square and 100ft. in height, and was illustrated in the BUILDING NEWS for July 1, 1898. Mr. Isaac Jones, of Deerbroke-road, Herne Hill, S.E., whose design was selected in competition, is the architect, and Messrs. Ben Graham and Sons, Huddersfield, were the builders.

On Monday week the foundation-stone of a new day-school in connection with St. Peter's Roman Catholic Church, Bloxwich, was laid. The new building is to accommodate 300 scholars, and is being built by Mr. Wootton, of Bloxwich, from the designs of Canon Soles, of Yeovil. The total cost will be about £2,350, including the site.

Aspinall's Emael, Limited, are rebuilding their extensive premises at New Cross, which were recently destroyed by fire, and hope to complete them by the end of November. The architect is Mr. Max Clarke, of Queen-square, W.C., and the contractors are Messrs. Whitehead and Co., Ltd., Portland Works, Clapham-road, S.W.

Mr. John Piggott, chairman of the South Eastern District Parks Committee of the London County Council, opened on Saturday a new gymnasium for girls at Southwark Park, and dedicated the carriage road across the park for night traffic. The two improvements have been executed under the direction of Lieut.-Col. Sexby.

The Stock Exchange at the corner of Dale-street and Exchange-street East, Liverpool, which has been enlarged from plans by Messrs. Grayson and Ould, of that city, was reopened on Saturday. The street façades, which are new, are Elizabethan in style, and are executed in red sandstone and Portland stone.

## Our Illustrations.

## "THE FOUR WINDS": A SUNDIAL.

THE sundial which I have sent to the Academy is intended for erection in a garden; its height is about 12ft., and the figures are about three-quarter life. These represent the North, West, South, and East Winds, and present the characteristics of each. It is my intention to execute it in a form of pottery which I am at present working upon. If I am able to get this done in time, I will exhibit it at the Arts and Crafts Exhibition this autumn. The actual dial is placed on the roof of the structure.

CONRAD DRESSLER.

## NATIONAL SILVER MEDAL DESIGNS FOR DECORATIONS OF RAILWAY CARRIAGES.

THIS scheme for the decoration of railway carriages, by Miss Isabel McBean, is intended to modernise the inside of the carriages, and to make travelling more interesting and comfortable for the traveller. The carriages are not altered in structure, but each class is decorated, utilising the spaces with suitable designs. The third class is decorated with stencilled panels. The ornamentation for the top of the second-class carriage is in modelled Lincrusta, coloured, and the rack of pierced copper. The first-class rack is of stamped leather with gold background, the same material being used for the panels overhead, with reading-lamps at each corner. Electric light is used throughout, and each class has an entirely different set of designs for door-plates, lights, brackets (which are of gunmetal), tapestry, &c., and the whole scheme takes into consideration strict economy of material and expense.

## THE LATER RENAISSANCE IN ENGLAND.

(See article on page 867.)

## NEW B. B. AND C. I. RAILWAY ADMINISTRATIVE OFFICES, BOMBAY.

THIS building was completed in January last. The architect is Mr. F. W. Stevens, C.I.E., F.R.I.B.A., &c., who was assisted by his son, Mr. C. F. Stevens, M.S.A. It is erected on a prominent site at the apex of the Marine lines and Queen's-road, and is a fine monument of British enterprise in India. Mr. Roscoe Mullins, of London, was the sculptor for the group of figures on the central gable, and the heads of Colonels French and Kennedy in the circular panels of carriage porch. A full description of the building was given in our issue of Feb. 24, 1899. The cost of the building was six and a half lacs of rupees.

## PISA CATHEDRAL.

THIS drawing of the interior of Pisa Cathedral was made by Mr. E. Gaunt, who sends us the following description:—The cathedral was

begun about the year 1067 in commemoration of a great naval victory of the Pisans, and was consecrated in the year 1118. The style is Pisan Gothic, the west front especially being very fine with its rows of shafted arcades, superimposed one above the other, and gradually diminishing in length towards the top of the building. The interior was thoroughly modernised in the 17th century, with the exception of the choir; the old columns being used again, and the capitals covered with stucco ornament. The cathedral consists of a nave with four aisles and transepts with apsidal terminations; the choir also terminates in an apse rather larger than those to the transepts. An elliptical dome surmounts the crossing of nave and transepts. The building measures 104 yards long and 35½ yards wide in interior. The perspective effects are remarkably fine in the interior, owing to the numerous ranges of columns. The whole is built in black and white marble (imitated in many places in stucco), adorned with mosaics by Cimabue and other masters, and is, all things considered, perhaps the finest example of Pisan Gothic in Italy.

## PUBLIC LIBRARY AND TECHNICAL SCHOOLS, GLOUCESTER.

MESSRS. WALLER AND SON are the architects of this building, but no further particulars have reached us.

## NEW POST OFFICE SAVINGS BANK, KENSINGTON.

IN our last issue we illustrated this important building, the foundation-stone of which was laid by the Prince of Wales on Saturday. It is to take the place of the existing savings bank in Queen Victoria-street, E.C. Owing to the enormous growth of the business, the present building, which has been enlarged twice during the last ten years, is much too small, and cannot be further enlarged except at very great expense. The plans and elevation published in our last number show the portion to be erected at once, which will accommodate upwards of 4,000 clerks. The perspective shows the completed building, which will provide accommodation for about 7,000 clerks. The general arrangement will be seen from the plan. Many of the rooms are very large, about 320ft. by 47ft. in some cases, and occupy the whole length of the building. The basement will be occupied principally by stores and the printing shops; the ground, first, second, and third floors by offices, and the fourth floor by the dining-rooms and kitchens, which are very extensive. The front portion of the building will be occupied by the male staff and the rear by the female staff. The engine and boiler-rooms, with the electric light and power and plant, will be in a separate building at the back, and the exhaust steam will be utilised for heating purposes. The construction throughout will be fireproof, the floors being of rolled steel joists imbedded in concrete and finished with wood blocks. The roof will be similar in construction and asphalted. Most of the interior will be lined with glazed bricks of varied tints. Electric passenger and goods lifts will be provided in connection with each staircase. The architect is Mr. Henry Tanner, F.R.I.B.A., and the contractors for the foundations are Messrs. Foster and Dicksee, of Rugby. The contract for the superstructure is not yet let.

The Local Government Board have sanctioned the borrowing by the urban district council of Exmouth of £34,000 for works of sewerage, and directing the retention of a portion of the town's yard as the site of the pumping station.

The school board for St. Mary Extra, Southampton, have adopted plans by Messrs. Mitchell, Son, and Gutteridge, of the latter town, for additions to Pear-street school and Wolston boys' school, at an estimated cost of £1,500.

The Ipswich Corporation have decided to increase the salary of their borough surveyor, Mr. E. Buckham, who has been 23 years in their employ, and has carried out during recent years several important sewerage schemes for various districts, from £500 to £550.

The members of the Birmingham Architectural Association visited on Friday the new Higher Grade Schools at Aston, now in course of erection, from the plans of Messrs. Crouch and Butler. The elevations are Free Renaissance in style, and are treated in Leicester sand bricks and Doulton's terracotta. The builders are Messrs. Bowen and Sons, of Birmingham.

## COMPETITIONS.

EDINBURGH.—Tuesday was the last day for the lodging of designs for the reconstruction of the Mid-Lothian County buildings, and it has transpired that fifteen architects have handed in their plans to Mr. A. G. Asher, the county clerk. The appointment of an architectural assessor to decide which of the competitors shall receive the premiums which the Council offer for the best designs will at once be made.

GLASGOW GLADSTONE STATUE.—The statue committee of the Glasgow Gladstone Memorial Fund have agreed to invite Messrs. Thorneycroft, Onslow Ford, Gilbert, and Frampton to send in models for the statue of the late Prime Minister, to be erected in George-square. A small premium is offered. The fund now amounts to about £3,900.

## CHIPS.

The work of re-erecting the south-west gable of the west front of Peterborough Cathedral has now progressed so far as the middle half of the wheel window. The demolition of the unsafe spire of the south flanking tower, which had a considerable portion removed in the memorable gale of March, 1895, is approaching completion.

The Government, through the Department of Woods and Forests, is in negotiation with the Duke of Beaufort for the purchase of Tintern Abbey and the ruins of Raglan Castle, with four thousand acres of land and the manorial rights.

The new county hospital of Bedford was opened on Wednesday week by the Duke of Bedford. The new buildings stand in the grounds adjoining the old infirmary, which is to be pulled down, and the site covers ten acres. The three wards for men, women, and children are built on the pavilion system, being over 100ft. apart. The administrative block, the operating block, and out-patients' departments are all separate. A chapel is also provided, and also a nurses' home. The cost of the whole hospital has been £38,000. The architect was Mr. H. Percy Adams, of London, and the contractors Messrs. Kerridge and Shaw, of Cambridge. The hospital has been illustrated in the BUILDING NEWS for Aug. 23 and Dec. 30, 1897, and Feb. 3 of the present year.

The Endowed Schools, Watford, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

On Monday, July 3, the Great Northern Railway Co. will open their new and commodious goods station at South Accommodation Bridge, Hunslet. This station is conveniently situated for dealing with goods, grain, mineral, and live-stock traffic for Hunslet and that portion of Leeds east of Call-lane, Vicar-lane, and North-street. Ample facilities will be given for the prompt unloading of market produce under cover. The stations and sidings cover an extensive area, and are fitted with all modern appliances for expeditiously dealing with all descriptions of goods, mineral, and live-stock traffic. Ample warehouse accommodation is also provided. All information as to rates, &c., may be obtained from the Company's agent, Mr. H. G. Robinson, Hunslet Station; also from Mr. J. W. Morton, district goods manager, Leeds; and Mr. R. H. Twelvrees, chief goods manager, King's Cross Station, London.

The large clock in the central tower of the Hotel Great Central, Marylebone-road, has four illuminated dials, each 8ft. 6in. across, and has been made and erected by Messrs. John Smith and Sons, Midland Clock Works, Derby.

New board schools are being erected at Hems-worth, Yorks, from the designs of Mr. W. E. Richardson, architect, of Rothwell, near Leeds, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

A brass memorial plate has been fixed in the rear of the pulpit in the parish church of Horsham, in memory of the late rector, the Rev. John Barrett-Lennard. The inscription states that: "Through his energy this ancient church was restored, enlarged, and beautified, the carved wood in the chancel was almost entirely the work of his own hands, a peal of 8 bells was placed in the tower, a fine organ replaced a harmonium, and a view of the church was opened out by a new approach from the high road." The work was executed by Mr. A. H. Pennells, of Horsham.

Mrs. Greville H. Palmer, the wife of the Master of the Mercers' Company, will unveil, on Monday next, Mr. Ernest Croft's picture of Queen Elizabeth opening the first Royal Exchange. The work is the gift of the Mercers' Company, and is presented in accordance with the scheme of mural decoration of the Royal Exchange.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLVI., XLIX., LI., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 80c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

F. DERRETT. (Sanitary inspectors, unfortunately, are not always chosen for their fitness. Men who have friends on vestries and local councils seem to find that pay better than knowledge.)

RECEIVED.—H. T. B.—C. L. W. (Bristol).—F. S. Co.—M. K. M. and Co.—E. G. (Liverpool).

## "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Dachs," "Ajax," "Astragal," "Tip," "Clegornie," "Cantab," "Speys," "Levenach," "La Poupee."

NOTE.—We are unable to return several contributions, the contributors having omitted to put name and address on back, in accordance with rules.

## Correspondence.

JAMESON v. SIMON.

To the Editor of the BUILDING NEWS.

SIR,—I have read with satisfaction your leader in this week's issue on the above case, which, I believe, will be endorsed by every architect. The case is still *sub judice*, as I have appealed it to the Second Division of the Court of Session, who, I trust, will reverse the decision of the Lord Ordinary.

Should the decision be upheld and become law, my feeling is—and I believe it to be generally shared by my fellow architects—that the case is of such importance that the profession should take the matter up with a view to an appeal to the House of Lords, so that we may know once and for all if, in addition to our already onerous duties, the law holds us to be (and it practically amounts to this) guarantors to our clients of the materials, the workmanship, and the good faith of the contractors employed by them.

I await the result of the appeal, but I would point out that in this case the contracts with the tradesmen contained the clause that "they shall uphold their work for two years after it is taken off their hands." The defect showed itself within twelve months. Comment seems almost superfluous.—I am, &c., FRANK W. SIMON.

16, Rutland-square, Edinburgh, June 23.

## Intercommunication.

## QUESTIONS.

[12253.]—**Architect's Liability.**—Is there any liability resting upon an architect after he has granted a certificate and the builder has not received payment on same from the owner? Has the builder any further claim upon the architect in the matter as being a third person acting between the two parties?—PRACTITIONER.

## REPLIES.

[12251.]—**Quantities for Moulded Cornice.**—Take the cubic stone which will contain the worked angle, next the plain faces and sunk joints of front, back, and end, the sunk work, and then the moulded work—the latter is girt by the length of moulding. I know of no treatise that will assist "Student" in showing how the quantities are taken and put down for an angle of cornice. It is just one of those items that authors pass over.—G.

[12252.]—**Expanded Metal in Plaster.**—With reference to the above, if you kindly refer your correspondent to us, we shall be pleased to furnish him with all particulars.—THE EXPANDED METAL CO., LTD., 39, Upper Thames-street, London, E.C.

[12256.]—**Tile-Hanging Wall.**—Write for particulars of Hall's "New Improved Patent Hanging Tiles," to Joseph Cliff and Sons, Baltic Wharf. These tiles are fixed without nails. They are impervious. Ordinary tiles are fixed to battens nailed to gauge on wall, and look well. If of good quality, they are a great protection to the wall, and would keep the wall dry.—G. H. G.

[12257.]—**Colouring Room.**—I should advise "Amateur" to select a wall-paper of warm colour, such as a shade of terracotta or salmon tint. The colour should be tolerably bright, and as there is little sun in such a room, a dark shade should be avoided. A light ground should predominate. A frieze may be added; if it is, it should be bright and of a cheerful pattern, of a lighter shade of colour. Get a few patterns of good paper and try the effect first.—AN ARCHITECT.

## Our Office Table.

THE Council of the Society of Architects being desirous of obtaining the views of provincial architects upon the question of Registration, have arranged to hold a series of meetings in the provinces, to which the best-known architects who reside within a reasonable distance of the localities chosen will be invited. The first of these meetings will take place at the board-room of the Cutlers' Hall, Sheffield, to-day (Friday), at 6.30 o'clock p.m., the President, Mr. Walter L. Emden, J.P., L.C.C., in the chair, when a paper on "The Statutory Registration of the Profession" will be read by Mr. Ellis Marsland, hon. secretary. The author will sketch the progress made by the Registration movement during the past thirteen years, and will explain the Registration Bill, its objects, and the qualifications proposed. A resolution approving of the measure will be proposed by Mr. R. Frank Vallance, F.R.I.B.A., of Mansfield, to be followed by a general discussion of the subject. An address will afterwards be given by the President on "Rights of Light and Air," to be also followed by a discussion on the desirability or otherwise of submitting all such questions to a technical tribunal in connection with the local municipal authority.

MR. LONG received at the Board of Agriculture on Friday a deputation introduced by Sir Barington Simeon, M.P., on the subject of a claim made by a large body of assistants in the Ordnance Survey Department to be placed in the position of Civil servants. Sir Francis Evans, M.P., explained that the whole class of public servants on whose behalf they appeared, although they were described as "temporary assistants," were not so as a matter of fact, but suffered disabilities on account of being so described. Their work was permanent, and they had to submit to all the usual restrictions of Civil servants, but without the pension of Civil servants, and they asked that in this respect their grievances should be met. Mr. Long gave a somewhat encouraging reply, and promised to communicate with the Treasury on the subject.

SIR THOMAS GIBSON-CARMICHAEL has presented the Museum of Science and Art at Edinburgh a censer of 14th-century Italian work, bought at the sale in London of the Bardini collection in the beginning of this month. The censer is of champlene enamel on copper, and has been gilt. Unfortunately, under the wear and tear of five or six centuries, much of the enamelling and gilding has disappeared, but sufficient remains to show the treatment clearly enough, and the general form of the censer, as well as the details

of the ornament, are still perfect. The censer forms an interesting companion to a navette placed beside it in the case of ecclesiastical plate on the first gallery of the great hall in the Museum. The similarity in the ornamentation of the censer and navette shows that they must have been intended to accompany each other. The Edinburgh Museum acquired the navette by purchase at the Bardini sale, but the price, £115, at which the censer was sold considerably exceeded the limit allowed to the agent who represented the Museum, and the thing became the property of a private collector. When Sir Thomas Gibson-Carmichael heard of its loss he communicated with the purchaser, who in his turn was anxious to buy the navette, induced him to sell the censer, and, having obtained it, has now presented it to the Museum. The bringing together of the two objects adds considerably to their value as museum specimens.

THE redwood forests of the Pacific Coast are described by Mr. Henry Gannett in the U.S. *National Geographic Magazine* as occupying a narrow strip hugging the coast from the southern boundary of Oregon, through Northern California, with an area of 2,000 square miles, in which the standing timber is estimated at 75,000,000,000ft. As measured by the amount of merchantable timber per acre, this is probably the densest forest on earth. In the Southern States and in Minnesota, tracts containing from 5,000 to 10,000ft. per acre are regarded as heavily forested; but around Eureka, Cal., the lumber companies have realised "an average of between 75,000 and 100,000ft. per acre." It is said that "there is on record a single acre, near Garberville, which yielded in the mill 1,431,350ft. in lumber. There was sufficient lumber on this acre to have covered it with a solid block of frame dwellings ten stories high." On the other hand, there is, unfortunately, no young growth nor sign of reproduction from seed. This indicates that, with the clearing away of the present forests, though the supply at the present rate of cutting will last 300 years, the redwood "as a source of lumber" will cease to exist. The progressive drying of the climate is suggested as the cause of the failure of the reproductive power.

THE United States Consul-General at Montreal, in a recent report on the forests of Canada, estimates the area under timber in the Dominion at 1½ million square miles, or over 37 per cent. of the total area. The proportion varies from nearly 75 per cent. in British Columbia to 40 per cent. in Manitoba and 30 per cent. in the North-West Territories. The quantity of pine cut annually is said to be a thousand million board feet, and the supply at this rate will last 40 years. The growth of new wood, in spite of the regulations, is not equal to the amount cut. In Ontario the important tree is the white or Weymouth pine, but there are also the red pine, spruce, hemlock, and others. The valuable black walnut, tulip, plane, and coffee trees are almost extinct. Quebec, with its newly-added territory, is now an even larger province than Ontario. The white pine is the most important tree, as in Ontario; but it is rapidly disappearing. Rich spruce is found in many districts; there is a great waste of hemlock on account of the bark. Some of the best cedar areas in the Dominion are on the north shore of New Brunswick. An unsurveyed area of about two millions of acres on the Upper Restigouche is reported to be full of good spruce and cedar. The once rich pine forests have been greatly impoverished. The same is true of Nova Scotia; a quantity of good spruce is left here, but is also being wasted. British Columbia possesses the largest compact timber resources in the world. The fringe only has been cut. The Douglass pine, cedar, spruce, Alaska pine, and other timber standing in the railway belt is estimated to amount to 25,000 million board feet. The coast also is heavily wooded as far north as Alaska; there is no white pine, but spruce attains perfection here. The total exports of wood and its manufactures from the Dominion amount to over seven millions sterling per annum, Quebec and Ontario sending nearly two-thirds of this amount, while almost the whole goes to the United States and to Great Britain in nearly equal quantities.

The University authorities of Oxford have sanctioned the plans of a pathological block in connection with the University Museum. The total cost is estimated at £10,000. The architect is Mr. J. Augustus Souttar, 61, Gracechurch-street, E.C.

## LEGAL INTELLIGENCE.

**WORKMEN'S COMPENSATION ACT AND DEFECTIVE LADDERS.**—*SKEGGS v. KEEN.*—In the Court of Appeal last week before Lord Justice A. L. Smith, Lord Justice Rigby, and Lord Justice Vaughan Williams, this appeal from an award of Judge Addison, Q.C., sitting at the Southwark County-court, under the Workmen's Compensation Act, 1897, was heard. The appellant, Alfred Skeggs, was in the employment of the respondents, A. and P. Keen, and was injured by falling off a ladder while in the course of his employment. The appellant brought an action against the respondents under the Employers' Liability Act, 1880, in the Southwark County-court, alleging that the ladder was defective. The action was tried on December 13, 1898, and the jury found that the ladder was not defective, and returned a verdict for the respondents, and the action was dismissed with costs. At the request of the appellant the Judge thereupon proceeded to assess compensation under section 1, subsection 4, of the Workmen's Compensation Act, 1897. The Judge assessed the compensation, at the request of both parties, at a lump sum instead of a weekly payment, and he awarded the appellant £23 4s. No application was then made by the appellant for costs, but the appellant's solicitor carried in a bill of costs. There were applications made in respect both of this bill of costs and of the respondents' bill of costs in the action, and on April 10, 1899, the Judge, after stating that the respondents were willing to, and did, admit their liability under the Workmen's Compensation Act, 1897, but refused to make an offer under the Employers' Liability Act, 1880, as they considered that the appellant had no case under that Act, but the action was brought instead, said that he found as a fact that all the costs (with one immaterial exception) which the respondents had incurred had been occasioned by the appellant bringing the action under the Act of 1880. He also decided that there was no jurisdiction to give the appellant any costs. Mr. Cyril Dodd, Q.C., and Mr. Moyses, for the appellant, contended (*inter alia*) that when the Judge proceeded to assess compensation under section 1, subsection 4, of the Workmen's Compensation Act, 1897, after the action was dismissed, he had jurisdiction to allow the workman the costs in respect of the assessment of the compensation. Counsel for the respondent were not called upon. The Court dismissed the appeal. Lord Justice A. L. Smith said that, according to the finding of the County-court Judge, the employers were willing to compensate the workman under the Act of 1897, but the workman persisted in going on under the Employers' Liability Act, 1880. He was defeated. He then asked the Judge to assess compensation under the Act of 1897, and the Judge did so. The appellant said that he was entitled to his costs of assessing compensation under the Act of 1897. It was unnecessary to decide the point of law raised, because it was clear that, considering how the appellant persisted in going on with his claim under the Act of 1880, the learned Judge made a perfectly right order. Lord Justice Rigby and Lord Justice Vaughan Williams agreed.

**UNSANCTIONED NEW STREETS.**—At North London Police-court, on the 26th inst., Mr. Henry Cresswell Foakes, of Camden-road, was summoned before Mr. Bros for the continuing offence of commencing the formation of a new street without the consent of the London County Council. Mr. Thomas Chilvers appeared for the Council, and Mr. Duckworth, barrister, was for the defendant. Mr. Chilvers said that the *locus in quo* was Carysfort-road, Clissold Park, in which district the defendant was freeholder of a considerable property. In February, 1897, he was summoned for laying out land as a street without the consent of the Council as required by section 7 of the London Building Act of 1894. The summons was heard by Mr. d'Eyncourt and dismissed with £12 12s. costs against the Council. The Council appealed to the Divisional Court, which in 1897 reversed the decision. The matter came back to this court, and then Mr. d'Eyncourt imposed a penalty of £3, with two guineas costs. As the defendant did nothing towards removing the hoardings or abandoning his intention of laying out the street, the defendant was again summoned in April, 1898, for continuing penalties, the Act providing for penalties of ten guineas a day in case of non-compliance with the magistrate's order. Mr. Bros, who then heard the case, held that an offence had been committed, but on the defendant consenting to give the Council formal notice that he had abandoned the street and remove certain hoardings from their then position to a level with the forecourts of other houses the summons was withdrawn *sine die*. The undertaking was given to remove, and the defendant promised to put the hoarding in the position required by the Council. This, however, had not been done a week ago, and on the application of the Council the summons was again put into the list. He (Mr. Chilvers), however, understood that the work had been done as required by the Council that day. Mr. Duckworth said that was so. Mr. Bros said the requirement of the County Council had now been complied with, and he

should only impose the nominal penalty of 10s. 6d., with £2 2s. costs.

**IN RE MACKINTOSH.**—Mr. Registrar Brougham heard on Friday an application by James Waugh Mackintosh, builder, for an order of discharge. The receiving order was made on August 10, 1898, the liabilities being returned at £12,081, and no available assets being disclosed. His Honour said that the bankrupt had on a previous occasion—namely, in 1874—made a composition arrangement with his creditors and paid 1s. in the pound on liabilities £1 500. His present position was due to his losses and liabilities incurred as a speculative builder, and particularly to judgment for £7,200 having been recovered against him by the petitioning creditor in respect of damages for breach of contract relating to the erection of a building in Dover-street, Piccadilly. It was not clear what experience of the building trade the bankrupt had when he embarked in it in March, 1889, but the result of his dealings was that he now came before the Court with large debts and no assets whatever. Taking into account the absence of assets and previous composition, and also the fact that the bankrupt had continued to trade after knowing himself to be insolvent and had not kept proper books of account, the discharge would be suspended for three years from October, 1898.

**TOXTETH GUARDIANS AND THEIR INFIRMARY.—CLAIM AGAINST LIVERPOOL ARCHITECTS.**—The guardians for Toxteth-park having brought an action in the High Court against Messrs. C. O. Ellison and Son, architects, of Liverpool, for alleged professional negligence, Mr. Pollock, Q.C., the official referee, sat at St. George's Hall, Liverpool, on Tuesday, Wednesday, and yesterday (Thursday) to deal with the claim. Mr. A. A. Hudson represented the guardians, and Mr. Segar appeared for Messrs. Ellison. Mr. Hudson referred in his opening statement to the serious nature of the charges involved, and said the plaintiffs claimed £1,563 damages for negligence, for the return of documents belonging to the guardians, and for moneys received by the defendants from Messrs. Kelly Bros., builders and contractors, Liverpool. A scheme for building a union infirmary in Smithdown-road was inaugurated by the guardians in 1890, and the defendants' designs were accepted, remuneration to be on the usual professional terms. It was agreed that the designs should permit additions to be made to the building from time to time, and in May, 1891, the guardians resolved that the terms of remuneration should be five per cent. for specification and 2½ per cent. for quantities. The schedule of the latter included a large amount of glazed brickwork for lining kitchens, sculleries, lavatories, corridors, &c., on the ground that extra expense for bricks would be saved because of the non-use of paint. Upon the bills of quantities made out tenders were invited, and finally that of Messrs. Kelly Bros. for £34,909 was accepted. Of that amount the sum of £4,804 indicated the cost of glazed brickwork. It was alleged by the plaintiffs that during the progress of the work the defendants allowed the builders to leave out the greater part of these bricks, plaster being used in some and salt-glazed bricks in other cases. The difference in the price of the two kinds of glazed bricks was £7 per thousand. The defendants made no deduction, and upon their certificate the guardians paid the full amount of the builders' bill. There was a second contract between the guardians and Messrs. Kelly to build three additional pavilions for the infirmary, and it was now alleged against the defendants that certain brickwork mentioned in the bill of quantities was not carried out, although the board paid for it. Counsel complained of various other matters. He said the defendants provided for a lightning conductor at a cost of £17, but they entered into a contract with Mr. Joseph Ball, of Oldham, to do the work for £163. The guardians refused to pay this sum, and Mr. Ball brought an action, the result being that Mr. Justice Wills held the defendants liable. It appeared from defendants' books that they received £200 from Kelly Bros. as a share of the costs in the action brought by Ball. Messrs. Ellison lost in the matter of the lightning conductor. The allegation of the guardians was that the defendants, after having made out the schedules of prices, entered into contracts with firms who supplied articles at a price below that in the schedules. A mass of letters was put in by counsel, who said that in the case of locks the schedule put them at 11s. 6d. apiece, but instead of 129 only 79 were used; but no reduction to the guardians was made, although the actual price of the articles was 5s. 6d. each. In the contract for the extension of the infirmary in 1895, the guardians decided to omit the arches and corridors connecting the older part of the building with the newer; but this work was retained in the quantities. Messrs. Kelly Bros., on the recommendation of the defendants, were accepted as contractors, the tender being £9,428. In regard to the present action, the defendants denied the allegations made against them, and it would be necessary to call a number of witnesses. Dealing with defendants' accounts,

Mr. Hudson said that in one block the difference in price between the salt-glazed bricks used and those scheduled was the large sum of £589. Mr. Henry Hallard, the first witness, said he had had thirty years' experience as clerk on building works, and in August, 1895, he undertook a similar position under the Toxteth Board of Guardians, who were building additions to the union infirmary in Smithdown-road. When he commenced his duties Mr. Guthrie was the foreman, and witness told him that he should require certain things done according to the plans on an understanding come to that if they were not put in the guardians should be allowed the difference between what was estimated for and what was executed. The foreman replied that Messrs. Ellison had altered certain things in the other pavilions, and that blocks C, F, and G were to be built as per the other blocks. Ignoring the foreman's statement, witness went to defendants' office, and told Mr. Ellison that the work was going to be done not only contrary to the quantities and specifications, but, in his opinion, contrary to the rules of building construction. The reply was that he (witness) must follow the other pavilions, and whatever adjustments were necessary at the completion of the work, they would be made. On that understanding the work was allowed to go on, and he took a careful account of what was done. On February 25th Mr. Ellison came to the works, and at that time witness had not seen the priced bill of quantities. The defendants also wrote that the quantities did not form part of the contract, but were taken full to cover errors. They added that witness's quantities were incorrect, and that £10 per 1,000 should be substituted for £15 on account of enamelled brickwork, and that all contractors were so informed when they made up their tenders. Mr. Hudson put in a copy of the list of quantities, showing the figure to be £15 per thousand bricks. The witness went on to say that Mr. Ellison said he wished the contract amount to remain unaltered at the end of the job. The quantities were supplied to witness by the builders, and he wrote to the defendants asking for a full list of the quantities as agreed when the tender was accepted. The reply was that they would see the work carried out and make the necessary adjustments on the completion of the contract. There was a strike, and the work was stopped for several months. In November, 1897, he wrote the defendants suggesting that the time was appropriate for making an adjustment. At that period he estimated the excessive quantities to be between £1,000 and £1,200. At that time he had not a copy of the priced bill of quantities. Several letters passed between them, and in one he complained that the glazed enamel work was not equivalent to the value specified for three pavilions. On January 31 in the following year Mr. Ellison, sen., went over the works, and remarked that when certain minor defects were remedied the whole thing would be dealt with in the ordinary way. On February 9 he received a letter from the defendants saying that Messrs. Kelly did not intend to make any claim for extras. It came upon witness like a thunderbolt. Mr. Hudson: I presume you have met few contractors who have not made a claim for extras ordered? Witness: It is quite a new experience to me. Continuing, Mr. Hallard said the letter went on to say that if Messrs. Kelly were letting their claim for extras be placed against the deductions to be made by the guardians, then they were having a good bargain. Witness replied that he was surprised no claim was to be made seeing the extras were ordered by the board. An account was sent in, but witness replied that he would not certify it as correct. A final account of the builders for the whole work was then sent in by the defendants. At the instruction of the guardians, witness prepared a list showing every item provided for in the quantities or in the specification, and indicating where there had been a deviation, or where the work had not been executed. Defendants sent an explanation, but it was untrue in some instances and incorrect in others. According to witness's figures, there was a total excess of £1,561 as between the quantities and the work done. Mr. Hallard gave several instances where the discrepancies had occurred, and mentioned that there were arches in the first-built blocks set out in the quantities for the second lot of blocks, whereas they had been done and paid for before. Cross-examined by Mr. Segar, the witness said it was the practice of architects to leave a margin for contingencies which might arise in the course of the work; this was in the shape of an amount of money to be deducted from the contract price, but not as regarded individual items in the quantities. His experience was that the quantities were mostly short. It was the rule to put at the bottom of the priced bill of quantities a note to the effect that "the quantities are taken out net." Witness had been in the building trade all his life. He had also been a singer of note in the district, but he retired years ago on his laurels. The original estimates for the work of erecting the workhouse infirmary were sent in in 1890, and there were several competitors. The defendants put in the lowest estimates for all

the blocks. Some of the blocks had been completed two years before witness became clerk of the works. He would admit that the cost of labour had gone up after the building of the first blocks; but he doubted if the ratio of increase was from 10 to 15 per cent. He believed that the final account of Messrs. Kelly was £9,277, but £100 was knocked off in settlement. Mr. Segar: Do you know that the work was completed at £500 less than the architects' estimate? The Official Referee: I presume that the architects' estimate is based on their quantities. It is not surprising, therefore, that he did it at less, if Mr. Hallard's evidence is correct. The witness proceeded to say in further cross-examination that the last set of blocks of building were completed in the same style as the first set. It was in September, 1896, that he told Mr. J. Moulding, clerk to the guardians, that there were alterations in the work, such as glazed bricks being used instead of enamel bricks. Mr. Ellison said the work was being carried out like that in the other pavilions, but there would be an adjustment on completion of the work. Witness said that on that understanding he would allow the building to go on. Mr. Segar: Would you be surprised to know that the actual additions to the work come to about the same in value as the work which you say has not been done? Witness: I should be very much surprised. The witness went on to state that in the building of the enamelled brick walls there was a saving of 12 bricks per superficial yard, because stretchers instead of headers were used. As they stood, such walls were not as good as if they had been built with headers. Mr. Segar: Our case is that the board of guardians have got every sixpence of value that we put into the work. We say the wall is as good, if not better, and at very near the same cost, as a more finished work. The witness admitted that during the progress of the work he found the contractors most obliging and ready to make any suggestions. At the close of the cross-examination, Mr. Segar said that practically their case was this—the final account sent in was a fair one, and the extras were set off against deficiencies. The Official Referee said that in that case it would be easy for the defendants to furnish the other side with particulars. Mr. Segar assented. Other witnesses on behalf of the plaintiffs were called, and the action will be continued to-day (Friday).

**SCHOOL GOVERNORS SUE AN ARCHITECT AND CONTRACTOR.**—At Grays County-court on Tuesday week, before his Honour Judge Paterson and a jury, the Governors of Palmer's Endowed Schools, Grays, brought an action against George Waymouth, architect, and George Benjamin Rous, builder, for damages for their alleged negligence in respect of certain drainage works in connection with the school. Mr. C. E. Jones was for the plaintiffs, Mr. W. Compton Smith for the architect, and Mr. Llewellyn Davis for the contractor. Mr. Compton Smith argued that as the case was full of technicalities, it would be better to go before an expert, pointing out that the contract provided for an arbitration in the event of dispute. The action was as to the construction of 1,072ft. of drainage.—Mr. Jones: If it were referred to an architect he would decide in favour of the architect, of course. If you would refer it to my solicitor I should be quite content. His Honour: What does your solicitor know about it? Mr. Jones: Nothing at all. But he would give us just as favourable a decision as the architect would the other way. It transpired that the work in question was done four or five years ago, and it was stated that by reason of its alleged inadequacy it had required patching ever since, until 1898, when the inspector of Grays Council, by whom the plans of the original drainage were passed, had the lot pulled up, and ordered a fresh system altogether. Counsel for the defence held that, however defective the drainage might be, the action of the Grays Council screened both architect and contractor, and no cause for action therefore lay with the governors. After a good deal of argument the action against the architect was adjourned for the plaintiffs to file the particulars of the claim of £50. In opening the case against the contractor, Mr. Jones said the drain pipes were laid up and down like a switchback; many of the pipes did not touch at all, and the joints, instead of being clay inside with a cement collar outside, were conspicuous by their absence. Waste pipes from lavatories were let into the ground and no connections made at all, and in one instance the ventilating pipe was hooked round the rain-water cistern. Other of the pipes had rough holes knocked into them for connections; no elbows or bends were used; and the ground was absolutely sodden and saturated with sewage when uncovered. In short, the governors had been put to the expense of £188 in remedying the defects as they appeared from time to time. In a letter to the governors it appeared that Mr. Rous admitted that a portion of the drainage was wrong, but accounted for that by saying that the workmen must have taken advantage of his temporary absence. Cross-examined, he denied that the foundations would subside. The further hearing of the case was adjourned until August 8.

### WAGES MOVEMENTS.

**THE BUILDING TRADE DISPUTE IN YORKSHIRE.**—A specially convened meeting of the Yorkshire Federation of the building trade was held on Monday afternoon at the Leeds and County Builders' Club, Leeds. Mr. John Spink, Sheffield, presided. The representatives of the workmen passed a resolution at Hull last week insisting upon the formation of a Conciliation Board. The proposition was very favourably entertained at the opening of Monday's meeting. A letter was read from the London Order of Bricklayers stating that at a Yorkshire conference of delegates the secretary was instructed to receive a deputation of five delegates with the view to settle the matters in the present dispute. After a prolonged discussion it was resolved to send a letter to the Bricklayers' Association stating that the employers appreciated the offer of the men in conference "with the object of bringing about a settlement of the present trade dispute." The meeting failed to see that a partial conference would conduce to that end. "If, however," the resolution went on to say, "a conference of the respective trades interested can be arranged, we shall be glad to meet you along with one representative from each union. We will further offer that if this conference is arranged, we will agree to withdraw the lock-out conditionally that all men return to work to their old masters, whether lock out or on strike, on the old conditions of wages, pending a settlement of the dispute between representatives of the Federation and of the operatives' societies." It was further decided that the basis of the conference be the proposed Conciliation Board and the "Yorkshire Manifesto." The conference will take place at the Queen's Hotel, Leeds, on Monday next.

**THE EDINBURGH JOINERS' DISPUTE.**—As the Edinburgh joiners have decided to strike for advanced wages, the Glasgow masters, with a view to supporting their fellow employers, have decided to lock out on an early date 25 per cent. of their men. The men's society threaten as a counterblast to declare a strike in the chief Scotch towns.

At the last sitting of the Norwich Consistory Court a faculty was decreed for alterations to the parish church of Brundall, East Norfolk, in accordance with plans prepared by Mr. A. J. Lacey, of Norwich. Considerable opposition had been raised to the proposal, and an alternative scheme of enlargement prepared by another architect practising in Norwich was put in.

A Local Government Board Inspector attended an inquiry at Blackpool on Friday with regard to the application of the corporation to borrow £3,697 for private street work. There was no opposition.

At Rugby on Saturday afternoon the Archbishop of Canterbury unveiled a statue of the late Mr. Thomas Hughes, who, as the author of "Tom Brown's Schooldays," assisted to make Rugby School and its famous headmaster, Arnold, known throughout the civilised world. The statue, which has been executed by Mr. Thomas Brock, R.A., is of marble, is 7ft. 6in. high, and stands on a pedestal of Cornish granite. On the pedestal is the name of Mr. Hughes, with the date of his birth and death, and with the notification that he was the author of "Tom Brown." Underneath is the inscription, "Watch ye, stand fast in the faith, quit you like men, be strong."
